MANUAL UPDATE

MANUAL IDENTIFICATION

Part Number: 30000-90172

Print Date: 12/79

Title: HP 3000 Series III
CE Handbook

UPDATE IDENTIFICATION

Update Number: 2

Print Date: 7/81

THE PURPOSE OF THIS MANUAL UPDATE

is to accumulate all changes to the current edition of the manual. Earlier updates, if any, are contained herein. This update consists of: this cover letter, a revised "List of Effective Pages," and all new and changed pages (backup pages are provided when necessary).

CHANGED PAGES ARE IDENTIFIED

by the date of the update at the bottom of the page and a vertical bar in the outside margin opposite the changed material.

NEW PAGES ARE IDENTIFIED

by the date of the update at the bottom of the page. "New" pages are those which were not present in the original edition of the manual.

TO UPDATE YOUR MANUAL,

replace change pages with the update pages and insert any new pages. Destroy all replaced pages. In the case of SECTION VII, DATA COMMUNICATIONS, remove all pages in the section, and replace them with new page 7-1 only.

HOW TO OBTAIN MANUAL UPDATES

If you need copies of this update, or any other update, please give the name of the manual, its part number, number of copies, and state clearly that you require the update, not the complete manual. There is no charge for manual updates. Send your request to:

Manuals/Software Dept. (Computer Systems Division)
Hewlett-Packard Company
19447 Pruneridge Ave.
Cupertino, CA 95014

HEWLETT-PACKARD COMPANY
19447 PRUNERIDGE AVE., CUPERTINO, CALIFORNIA 95014

Printed in U.S.A.

LIST OF EFFECTIVE PAGES

The List of Effective Pages gives the date of the current edition and of any pages changed in updates to that edition. Within the manual, any page changed since the last edition is indicated by printing the date the changes were made on the bottom of the page. Changes are marked with a vertical bar in the margin. If an update is incorporated when an edition is reprinted, these bars are removed but the dates remain. No information is incorporated into a reprinting unless it appears as a prior update.

PRINTING HISTORY

New editions are complete revisions of the manual. Update packages, which are issued between editions, contain additional and replacement pages to be merged into the manual by the customer. The date on the title page and back cover of the manual changes only when a new edition is published. When an edition is reprinted, all the prior updates to the edition are incorporated. No information is incorporated into a reprinting unless it appears as a prior update. The edition does not change.

The software product part number printed alongside the date indicates the version and update level of the software product at the time the manual edition or update was issued. Many product updates and fixes do not require manual changes, and conversely, manual corrections may be done without accompanying product changes. Therefore, do not expect a one to one correspondence between product updates and manual updates.

First Edition	Dec 1979
Update No.1	Mar 1980
Update No.2	Jul 1981

PREFACE

This handbook has been prepared for the Hewlett Packard Customer Engineer. It contains a collection of frequently used system and subsystem data items which are used in servicing and troubleshooting the HP 3000 Series III Computer System.

The content of this handbook is arranged into eleven logical sections. Each section is separated by an index tab. The first page of each section contains a table of contents for the section.

Throughout this handbook, some of the data items carry a three-letter reference code. This reference code is a directory to the manual in which the data item originally appeared. If you require additional information about a referenced data item, refer to the manual designated by the three-letter code. The following manuals are referenced from this handbook:

The following is an alphabetic listing of the manuals referenced from this handbook

EDS	Engineering Diagrams Set, part no. 30000-90141
OPR	Console Operator's Guide, part no. 30000-90013
RTM	System Reference/Training Manual, part no. 30000-90143
SIM	System Installation Manual, part no. 30000-90147
SML	System Microprogram Listing, part no. 30000-90136
SUP	System Manager/System Supervisor Manual, part no. 30000-90014

The organization of this handbook is as follows:

Section I - System Information contains information relative to PCA slot assignments, flat cables, flat cable terminators, and system troubleshooting aids.

Section II - Central Processor Unit contains information relative to the CPU, its PCA jumper and switch locations, system startup and backup procedures, and some basic CPU/MPE information.

Section III - Memory contains information relative to the memory module, its PCA jumper and switch locations, and its error correction capabilities.

PREFACE (continued)

Section IV - IOP/Channels contains information relative to the IOP, Multiplexer and Selector Channels, and the Selector Channel Maintenance PCA. Included are PCA jumper and switch locations, word formats, and LED indicator locations and functions.

Section V - I/O System Configuration contains both hardware and software configuration information for the system. Included in the hardware subsection are device number assignments, service request priorities, interrupt polling and clock jumper and terminator information, and power bus backplane connections. Included in the software subsection is a list of driver names, types, sub-types, and record widths, driver configuration information, term types, and a typical I/O configuration listing.

Section VI - Power Distribution contains information relative to system ac and dc power distribution, the system power supplies, and battery care.

Section VII

Section VIII - Peripherals contains information relative to the various subsystems and devices associated with the computer system. Included are the subsystem connections, PCA jumper locations, and word formats.

Section IX - Diagnostics contains information relative to the CPU diagnostics, on-line verification programs, and non-CPU cold load diagnostics.

Section X - Contributed SLEUTH Programs contains a collection of contributed SLEUTH program listings, as well as the supported SLEUTH batch program listings for SLEUTH01, SLEUTH03, SLEUTH04, SLEUTH06, SLEUTH07, SLEUTH08, SLEUTH11, SLEUTH12, SLEUTH13, and SLEUTH14.

Section XI - Error Messages contains cold load error messages, directory errors, a list of hardware halts, and SADUTIL, LISTLOG2, and MEMLOGAN error messages.

MICRODIAGNOSTICS

CONTROL PANEL TESTS AND FUNCTIONS

Stored in the microcode are diagnostics to test the CPU registers, memory, I/O channels, magnetic tape subsystem, and the asynchronous terminal data PCA's. Diagnostics are executed from the system's control panel. The microcode also provides the following functions:

- a. Display Memory Logging Errors
- b. Read/Write Memory
- c. Display Register Contents

CPU REGISTER TEST

Proceed as follows to test the various CPU registers.

- a. Set the SYSTEM SWITCH REGISTER to %000001.
- b. Press the ENABLE and LOAD switches.
- c. The program runs continuously until the HALT switch is pressed or until an error occurs.

Upon detection of an error, the test pauses in the run mode with the CURRENT INSTRUCTION REGISTER (CIR) displaying "bad bits". Press the RUN/HALT switch to obtain a code designating the failing register. Decode the display using the following table.

CPU REGISTER CODES

CIR %	REGISTER	LOCATED ON
00	SP1 (Note)	R-Bus PCA
01	PL	R-Bus PCA
02	Z	R-Bus PCA
03	X	R-Bus PCA
04	RD (R-Bus)	R-Bus PCA
05	RC (R-Bus)	R-Bus PCA
06	RB (R-Bus)	R-Bus PCA
07	RA (R-Bus)	R-Bus PCA
10	SP0	R-Bus PCA
11	CRTL	S-Bus PCA
12	P	S-Bus PCA
13	Q	S-Bus PCA
14	DB	S-Bus PCA
15	SM	S-Bus PCA
16	STA	SSF and S-Bus PCA's
17	SP3	S-Bus PCA
20	OPND	CIR PCA
21	DL	S-Bus PCA
22	SP2	S-Bus PCA
23	PB	S-Bus PCA
24	PCIK	S-Bus PCA
25	RD (S-Bus)	S-Bus PCA
26	RC (S-Bus)	S-Bus PCA
27	RB (S-Bus)	S-Bus PCA
30	RA (S-Bus)	S-Bus PCA
31	CTRH	S-Bus PCA
32	ABS-BANK	SSF PCA
33	PB-BANK	SSF PCA
34	DB-BANK	SSF PCA
35	S-BANK	SSF PCA

NOTE

SP1 is the first register tested and the problem may not necessarily be in SP1 but somewhere previous in the data path (Store logic, Shifter, ALU, etc.)

System Information

MEMORY PATTERN TEST

This test writes and then immediately reads back any bit pattern entered into the SYSTEM SWITCH REGISTER. The pattern pervades all of memory. The initial pattern is %100000. The current pattern is displayed in the CIR. Perform this test as follows:

- a. Set the SYSTEM SWITCH REGISTER to %100000.
- b. Press the ENABLE and LOAD switches.
- c. The test runs continuously until an error occurs or, if the RUN/HALT switch is pressed, until the end of a pass.

If an error is detected, the test halts and the CIR displays the error type as follows:

CIR = 0 Data Compare Error
CIR(4) = 1 System Parity Error
CIR(5) = 1 Address Parity Error
CIR(6) = 1 Multiple-Bit Error

Press the RUN/HALT switch for a CIR display of memory bank number, press again for address, and press again for expected data XOR actual data (bad bits).

MEMORY ADDRESS TEST

This test loads the memory with address dependent data and then checks it while reading it back. Perform this test as follows:

- a. Set the SYSTEM SWITCH REGISTER to %000000.
- b. Press the ENABLE and LOAD switches.
- c. The test runs continuously until an error occurs or, if the RUN/HALT switch is pressed, until the end of a pass.

If an error is detected, the test halts and the CIR displays the error type as follows:

CIR = 0 Data Compare Error
CIR(4) = 1 System Parity Error
CIR(5) = 1 Address/Data Bus Parity Error
CIR(6) = 1 Multiple-Bit Error

Press the RUN/HALT switch for a CIR display of memory bank number, press again for address, press again for actual data, and press again for expected data.

I/O TEST (TIO)

This test sends a TIO command to device numbers %2 through %177 in turn, and then pauses with the TIO status of each responding device in the CIR. Pressing the RUN/HALT switch advances to the next device. Perform this test as follows:

- a. Set the SYSTEM SWITCH REGISTER to %000002.
- b. Press the ENABLE and LOAD switches. The test pauses with %000002 in the CIR. This is the device number of the Sys-Clock/FLI PCA.
- c. Press the RUN/HALT switch to display TIO status of that device.
- d. Press the RUN/HALT switch for the device number of the next responding device, then once more for TIO status of that device.
- e. Repeat step d until the CIR displays %000200 and the SYSTEM HALT light is lighted.

I/O TEST (SIO)

This test executes an SIO program consisting of only an END-ORDER for all devices in turn that have the SIO OK bit set in the TIO status word. It pauses for each with the END-ORDER status in the CIR. Press the RUN/HALT switch to advance to the next device. Perform this test as follows:

- a. Set the SYSTEM SWITCH REGISTER to %100002.
- b. Press the ENABLE and LOAD switches.
- c. The CIR displays the device number of the first responding device that has the SIO OK bit set in its TIO status. Press RUN/HALT to display SIO END-ORDER status for that device.
- d. Press the RUN/HALT switch for the device number of the next responding device and then once more for SIO status of that device.
- e. Repeat step d until the CIR displays %000200 and the SYSTEM HALT light is lighted.

System Information

START I/O TEST

This test issues a start I/O (SIO) command to a device and then waits for an interrupt from that device. An RIL is sent to any other interrupting devices. After receiving the interrupt, the function system-halts with the CIR displaying TIO status from the device if the command succeeded or %030370 if the command failed.

This test assumes that an SIO program is already in memory and that the DRT pointer at DEVNO*4 has been initialized. Perform this function as follows:

- a. Set the SYSTEM SWITCH REGISTER to %005000.
- b. Press the ENABLE and LOAD switches. The system pauses with %005000 in the CIR.
- c. Set the SYSTEM SWITCH REGISTER bits 9 through 15 to the device number.
- d. Press the RUN/HALT switch to send the SIO command to the device.

MAG-TAPE TEST

This test writes a 4K-word record to tape from each memory bank, correcting for tape errors by issuing a backspace record followed by a write gap and then retrying. After this write operation, the tape is rewound and each 4K-word record is read into another area of its source memory bank. The data written is compared with the data read and the test halts if an error is detected. The test runs continuously if no error is found. If the SIO command to the tape unit fails, the test halts with %030370 in the CIR. Perform this test as follows:

- a. Set the SYSTEM SWITCH REGISTER to %006000.
- b. Press the ENABLE and LOAD switches. The test pauses with %006000 in the CIR.
- c. Set bits 7 through 15 of the SYSTEM SWITCH REGISTER to the device number of the tape drive to be tested.
- d. Press the RUN/HALT switch to start the test.

System Information

On a halt, the CIR displays the current bank in bits 0 through 3 and the mag tape command in bits 12 through 15. The test halts if an error is detected or, if the RUN/HALT switch is pressed, until a pass is completed. If the test halts on an error, subsequent pressing of the RUN/HALT switch causes the following sequence of displays.

1	STATUS	Privileged mode, enable interrupt, CST#1*
2	SPI	Data word written
3	SP2	Data word read
4	TOS	Not used
5	PB-BNK	Current I/O bank address
6	PB	SPI XOR SP2 (failing bit)
7	P	Write buffer address
8	PL	Read buffer offset
9	DB-BNK	Not used
10	DB	Device number under test
11	S-BNK	Always 0
12	DL	CCPX parameter word
13	Q	Device number times 4 (DRT)
14	SM	Used as address pointer to build SIO program.
15	Z	I/O bank in bits 0, 1, and 2
16	INDEX(X)	Interrupting device number

* 14001

System Information

ASYNCHRONOUS TERMINAL CONTROLLER SUBSYSTEM TEST

This test causes characters typed on a selected terminal to be echoed and the ASCII code of the character to appear in bits 7 through 15 of the CIR. A non-responding device halts the test with %030370 in the CIR. Perform this test as follows:

- a. Set the SYSTEM SWITCH REGISTER to %007000.
- b. Press the ENABLE and LOAD switches. The test pauses with %007000 in the CIR.
- c. Enter the device number of the asynchronous terminal controller in bits 7 through 15 and the port number in bits 3 through 6 of the SYSTEM SWITCH REGISTER.
- d. Press the RUN/HALT switch. The test pauses with the CIR equal to the switch register.
- e. Enter the character size parameter into bits 5 through 7 and the baud rate parameter into bits 8 through 15.
- f. Press the RUN/HALT switch. The test pauses with the CIR equal to the switch register.
- g. Press the RUN/HALT switch.
- h. Strike keys on the terminal's keyboard and observe that the characters are echoed correctly and the ASCII code for each character is displayed in bits 7 through 15 of the CIR.

The character size parameter is the three least significant bits of the sum of the number of start, parity, data, and stop bits in a transmitted character less one.

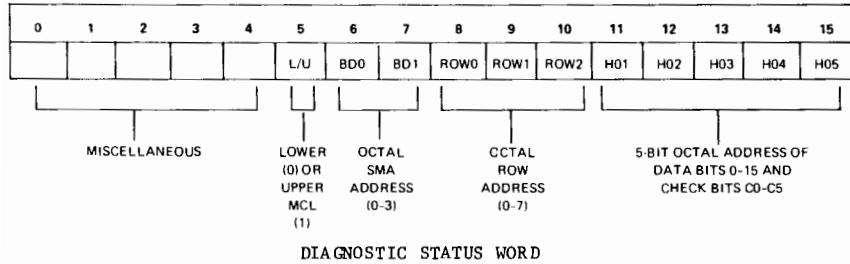

To calculate the baud rate parameter, divide decimal 14400 by the device bit rate, round off to the nearest integer, and subtract one. Convert the decimal answer to octal.

Some octal examples of character size and baud rate parameters are as follows:

DEVICE	CHARACTER PARAMETER	BAUD PARAMETER	OVERALL() SETTING
ASR 33 Teletype	2	202	1202
30-CPS Terminal	1	057	457
60-CPS Terminal	1	027	427
120-CPS Terminal	1	013	413
240-CPS Terminal	1	005	405

DISPLAY MEMORY LOGGING ERRORS FUNCTION

This function transfers the contents of the error logging arrays (one error logging array is on each of up to two MCL PCA's) to the I/O logging array on the fault logging interface (FLI) PCA. It then interrogates the System Clock/FLI PCA and displays the diagnostic status word in the CIR for each error logged. The diagnostic status word shown below contains the information needed to find failing RAM's.

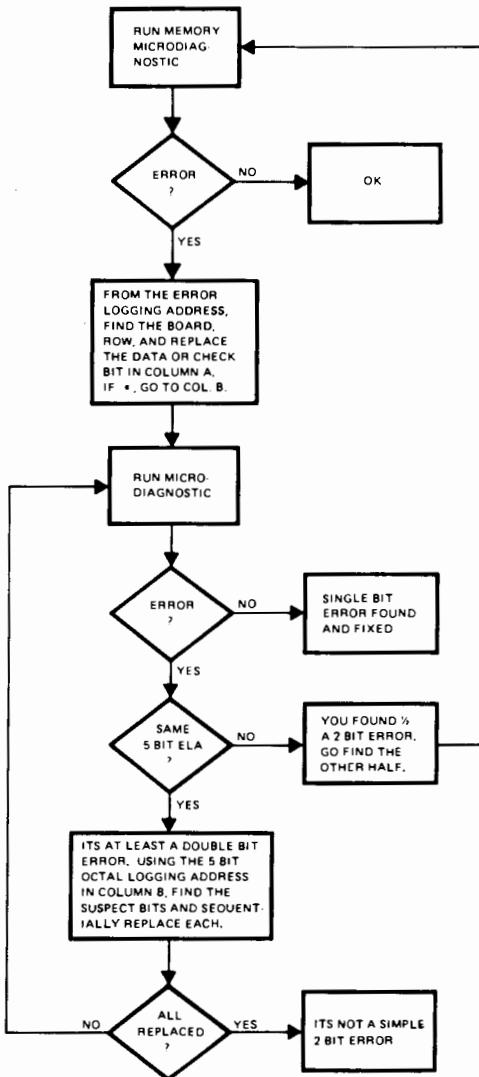

Perform this function as follows:

- Set the SYSTEM SWITCH REGISTER to %001000.
- Press the ENABLE and LOAD switches. The test pauses with %001000 in the CIR.
- Press the RUN/HALT switch to observe the RIO status word for the first error logged. If no errors are logged, the CIR display is 000000 and the SYSTEM HALT light is lighted.
- Press the RUN/HALT switch again for the next and subsequent errors. When the CIR display is 000000 and the SYSTEM HALT light is lighted, all errors have been observed.

The function system halts with %030370 in the CIR if the System Clock/FLI PCA does not respond. When an error is detected, use the following faulty chip locating flowchart and conversion table to isolate the error to a single-bit error, a double-bit error, or more than a double-bit error. Use the row and chip locator illustration to locate the failing RAM(s).

ROW AND CHIP LOCATOR

CONTROL PANEL READ/WRITE MEMORY FUNCTION

This function allows memory to be written or read from the system control panel on a word-by-word basis. This function allows reading and writing while incrementing or decrementing memory addresses. To use this function, set one of the following bit patterns into the SYSTEM SWITCH REGISTER.

- a. To write while incrementing memory: %002000
- b. To read while incrementing memory: %003000
- c. To write while decrementing memory: %102000
- d. To read while decrementing memory: %103000

Then proceed as follows:

- a. Press the ENABLE and LOAD switches. The system pauses with the CIR equal to the switch register.
- b. Enter the selected bank address (0 - %17) in bits 12 through 15 of the SYSTEM SWITCH REGISTER.
- c. Press the RUN/HALT switch. The system pauses with the bank number in the CIR.
- d. Enter the starting address (0 - %177777) in the SYSTEM SWITCH REGISTER.
- e. Press the RUN/HALT switch. The system pauses with the starting address of the read or write operation in the SYSTEM SWITCH REGISTER.

For a memory write, set the data word to be written into the SYSTEM SWITCH REGISTER. Press the RUN/HALT switch to write the first data word at the starting address. If required, change the data word in the SYSTEM SWITCH REGISTER and press the RUN/HALT switch to write the data word at the incremented or decremented memory address. The data word is displayed in the CIR after it is written into memory.

For a memory read, press the RUN/HALT switch to read the data word at the starting address. The data word is displayed in the CIR. Press the RUN/HALT switch again to read the data word at the incremented or decremented address.

Addresses do not cross bank boundaries, address 000000 follows address %177777.

A SYSTEM/HALT occurs if an attempt is made to read or write non-existent memory.

System Information

DISPLAY REGISTER FUNCTION

This function displays the contents of most of the CPU registers and the contents of the top-of-stack in memory. Pressing the RUN/HALT switch causes the CIR to display the contents of the following registers in the order shown below:

00 - STATUS	10 - DB-Bank
01 - SPI	11 - DB
02 - SP2	12 - S-Bank
03 - TOS = MEM(SM)	13 - DL
04 - PB-Bank	14 - Q
05 - PB	15 - SM
06 - P	16 - Z
07 - PL	17 - X

To use this function, proceed as follows:

- a. Set the SYSTEM SWITCH REGISTER to %004000.
- b. Press the ENABLE and LOAD switches. The system pauses with %004000 in the CIR.
- c. Press the RUN/HALT switch as needed to observe register contents.

The function will SYSTEM HALT when the Index Register (X) has been displayed.

COLD LOAD PROCEDURE (TAPE)

The following is the SIO program built by the microcode for a cold load from tape:

```
30 = 001430
1430 = 014000
1431 = 000000
1432 = 040000
1433 = 000006
1434 = 077760
1435 = 001400
1436 = 000000
1437 = 001400
```

MAINTENANCE PANEL SET-UP

- a. Place all switches down.
- b. Set TIMERS switch to INHIBIT.
- c. Press SYSTEM RESET switch.
- d. Set V-BUS COMPARE REGISTER to %7103.
- e. Set V-BUS COMPARE switches to ENABLE and HALT.
- f. Set SWITCH REGISTER on Mini Panel to 003006.
- g. Press ENABLE and LOAD switches on Mini Panel.

The panel will freeze with %7104 displayed in the V=BUS COMPARE REGISTER. The PANEL FREEZE and FREEZE lamps will be lighted.

- h. Set CLOCK switch to INHIBIT.
- i. Press and hold down the V-BUS COMPARE HALT EXIT switch.
- j. Press and count clocks using the CLOCK SINGLE CYCLE switch until the CPU LORQ indicator lights (3 clocks).
- k. Release the V-BUS COMPARE HALT EXIT switch.

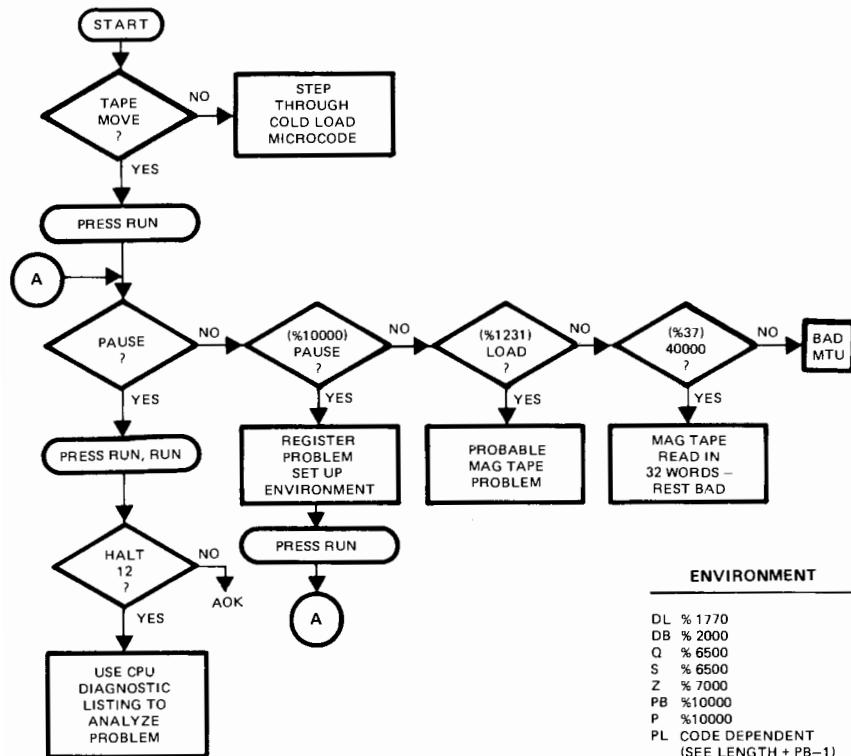

The SINGLE CYCLE REGISTER DISPLAY switch must be in the REGISTER position (up) to display the Selected Registers given in the following listing. The following conventions are used throughout the listing:

- = don't care
0 = zero in display

Clocks are counted in decimal, other numbers are in octal.

System Information

FREE2

FREE2 prints histograms of available disc space and the total number of entries in the Free-Space Table. In the listing, each disc configured in the system is identified by volume name and the histogram for that disc follows this name. The total number of Free-Space Table entries in the system appears at the end of the list.

To run FREE2, log on to the system and enter:

:RUN FREE2.PUB.SYS

LISTLOG2

LISTLOG2 prints the contents of any MPE Log Files existing in the system. These files are created under the user and account names MANAGER.SYS.

NOTE

The output from LISTLOG2 can be directed to any output file on any device. (LISTLOG2 recognizes this file by the formal designator LOGLIST, assigned the device class name LP.)

:RUN LISTLOG2.PUB.SYS

System Information

WORKOUT2

```
:RUN FREE2.PUB.SYS (Checks available disc space.)  
(WORKOUT2 is 4096 sectors long and opens in 1024 sector blocks.)  
Restore WORKOUT2 into HP32230.SUPPORT  
Use SWITCHLOG to close current log file and start a new log file.  
:RUN WORKOUT2.PUB.SYS;PARM=X
```

X=1 Will eliminate comparing of data buffers after each read and
should not be used except for performance measurement.

X=2 Will cause END OF PASS messages to be displayed on the con-
sole as well as \$STDLIST.

X=3 Will give both 1 and 2 above.

If PARM is not specified, neither 1 or 2 above is executed.

NUMBER OF DISC FILES? (0 - 64)	Note 1
LDN FOR FILE #X? (0 - 255)	Note 2
IS A SORT TO BE DONE? (Y or N)	Note 3
NUMBER OF TAPE FILES? (0 - 4)	Note 4
NUMBER OF PASSES? (0 - 32,766)	Note 5

NOTES

1. Default = 0. Refer to Notes 3 and 4.
2. Default = 0. Zero causes the extents of the file to be spread over all discs in device class DISC. Any other number causes all extents of the file to be on the disc specified.
3. Use of this function is not recommended. Default = no. This question will only be asked if reply to NUMBER OF DISC FILES? is greater than 1. A yes reply causes file #1 to be sorted and written to file #N where N is the last file specified.
4. Default = 0. If reply to NUMBER OF DISC FILES? is zero and this reply is zero, the program will terminate. Any other reply will be the number of tape files WORKOUT2 will attempt to open.
5. Default = 0. If reply is zero, the program will terminate immediately. Any other reply causes WORKOUT2 to perform that number of passes and then terminate.

```
:RUN LISTLOG2 .PUB.SYS (Outputs I/O errors from the log file.)
```

System Information

SPOOK

SPOOK allows you to interrogate and operate on spooled device-files (spoolfiles) created and maintained by MPE. SPOOK runs under control of MPE and only in on-line (session) mode.

To run SPOOK, log on to the system and enter:

:RUN SPOOK.PUB.SYS

For an explanation of all SPOOK commands, enter either XPLAIN or HELP after the program prompt (>).

DISKED2

DISKED2 allows you to modify or display the contents of a disc according to absolute sector addresses. To execute DISKED2 you must have System Manager capability. This program run in Privileged Mode.

To run DISKED2, log on to the system and enter:

:RUN DISKED2.PUB.SYS

For an explanation of all DISKED2 commands, enter HELP after the program prompt (>).

LOGICAL/PHYSICAL SECTOR ADDRESS EXAMPLES

The following examples convert a logical sector address into a physical sector address:

7905A DISC DRIVE

DISCS	= 2	TOTAL DATA WORDS PER
HEADS	= 3 DATA (0-2)	SECTOR = 128
	1 SERVO	TRACK = 48(128) = 6144
		HEAD = 406(6144) = 2 494 464
CYLINDERS	= 415 (000 OUTER)	DRIVE = 3(2 494 464) = 7 483 392
	(405 INNER)	
		= 406 EFFECTIVE (10 SPARE)

SECTORS = 48/HEAD; UP TO 144/CYLINDER DEPENDING ON SUBTYPE

LOGICAL SECTOR ADDRESS = R1 + R2 WHERE R1 = 48(HEAD) + SECTOR
R2 = 144(CYLINDER)

FIRST LOGICAL SECTOR = R1 + R2 WHERE R1 = 48(0) + 0 = 0
= 0 + 0 R2 = 144(0) = 0
= 0

LAST LOGICAL SECTOR = R1 + R2 WHERE R1 = 48(2) + 47 = 143
= 143 + 58 320 R2 = 144(405) = 58 320
= 58 463

TOTAL DATA WORDS = 58 463(128) = 7 483 264

TO CONVERT A LOGICAL SECTOR ADDRESS TO A PHYSICAL SECTOR ADDRESS:

CYLINDER + REMAINDER A	HEAD + REMAINDER B
144 LOGICAL SECTOR ADDRESS	48 REMAINDER A

REMAINDER B = SECTOR

USING THE LAST LOGICAL SECTOR ADDRESS THIS IS:

405 RA 143	2 RB 47	CYLINDER = 405
-----	-----	HEAD = 2
144 58463	48 143	SECTOR = 47

System Information

7920A DISC DRIVE

DISCS	= 3	TOTAL DATA WORDS PER
HEADS	= 5 DATA (0-4)	SECTOR = 128
1 SERVO		TRACK = 48(128) = 6144
CYLINDERS = 823 (000 OUTER)		[HEAD = 815(6144) = 5 007 360
(822 INNER)		DRIVE = 5(5 007 360) = 25 036 800
	= 815 EFFECTIVE (8 SPARE)	

SECTORS = 48/HEAD; 240/CYLINDER

LOGICAL SECTOR ADDRESS = R1 + R2 WHERE R1 = 48(HEAD) + SECTOR
R2 = 240(CYLINDER)

FIRST LOGICAL SECTOR = R1 + R2 WHERE R1 = 48(0) + 0 = 0
= 0 + 0 R2 = 240(0) = 0
= 0

LAST LOGICAL SECTOR = R1 + R2 WHERE R1 = 48(4) + 47 = 239
= 239 + 195 360 R2 = 240(814) = 195 360
= 195 599

TOTAL DATA WORDS = 195 600(128) = 25 036 800

TO CONVERT A LOGICAL SECTOR ADDRESS TO A PHYSICAL SECTOR ADDRESS:

CYLINDER + REMAINDER A	HEAD + REMAINDER B
-----	-----
240 LOGICAL SECTOR ADDRESS	48 REMAINDER A
REMAINDER B = SECTOR	

USING THE LAST LOGICAL SECTOR ADDRESS THIS IS:

814 RA 239	4 RB 47	CYLINDER = 814
-----	-----	HEAD = 4
240 195599	48 239	SECTOR = 47

System Information

7925A DISC DRIVE

DISCS	= 5	TOTAL DATA WORDS PER
HEADS	= 9 DATA (0-8)	SECTOR = 128
	1 SERVO	TRACK = 64(128) = 8192
		HEAD = 815(8192) = 6 676 480
CYLINDERS	= 823 (000 OUTER)	DRIVE = 9(6 676 480) = 60 088 320
	(822 INNER)	
		= 815 EFFECTIVE (8 SPARE)

SECTORS = 64/HEAD; 576/CYLINDER

LOGICAL SECTOR ADDRESS = R1 + R2 WHERE R1 = 64(HEAD) + SECTOR
 R2 = 576(CYLINDER)

FIRST LOGICAL SECTOR = R1 + R2 WHERE R1 = 64(0) + 0 = 0
 = 0 + 0 R2 = 576(0) = 0
 = 0

LAST LOGICAL SECTOR = R1 + R2 WHERE R1 = 64(8) + 63 = 575
 = 575 + 468 864 R2 = 576(814) = 468 864
 = 469 439

TOTAL DATA WORDS = 469 440(128) = 60 088 320

TO CONVERT A LOGICAL SECTOR ADDRESS TO A PHYSICAL SECTOR ADDRESS:

CYLINDER + REMAINDER A	HEAD + REMAINDER B
576 LOGICAL SECTOR ADDRESS	64 REMAINDER A
REMAINDER B = SECTOR	

USING THE LAST LOGICAL SECTOR ADDRESS THIS IS:

814 RA 575	8 RB 63	CYLINDER = 814
		HEAD = 8
576 469439	64 575	SECTOR = 63

System Information

ASCII CODE CHART

HOW TO USE THIS TABLE									
<ul style="list-style-type: none"> • The table is sorted by character code, each code being represented by its decimal, octal, and hexadecimal equivalent. • Each row of the table gives the ASCII and EBCDIC meaning of the character code, the ASCII↔EBCDIC conversion code, and the Hollerith representation (punched card code) for the ASCII character. 									
<p>The following examples describe several ways of using the table:</p>									
<p>Example 1: Suppose you want to determine the ASCII code for the \$ character. Scan down the ASCII graphic column until you locate \$, then look left on that row to find the character code — 36 (dec), 044 (oct), and 24 (hex). This is the code used by an ASCII device (terminal, printer, computer, etc.) to represent the \$ character. Its Hollerith punched card code is 11-3-8.</p>									
<p>Example 2: The character code 5B (hex) is the EBCDIC code for what character? Also, when 5B is converted to ASCII (for example, by FCOPY with the EBCDICIN option), what is the octal character code? First, locate 5B in the hex character code column and move right on that row to the EBCDIC graphic which is \$. The next column to the right gives the conversion to ASCII, 044. As a check, find 044 (oct) in the character code column, look right to the ASCII graphic column and note that \$ converted to EBCDIC is 133 (oct) which equals 5B (hex).</p>

SYSTEM STARTUP PROCEDURES

There are two basic system startup procedures; one for a disc based system and one for a mag tape based system (from SYSDUMP Tape).

DISC BASED SYSTEM STARTUP

COLDSTART:

- a. Starts the system from disc.
- b. Does not recover current work (spoofles).
- c. Second fastest way to start a system.

WARMSTART:

- a. Starts the system from disc.
- b. Recovers (saves) current spoofles (spooled output or input information).
- c. Probably the fastest way to start a system.
- d. Only applies to crashes or if terminals hang up.

NOTE

You must reset the outfence to its appropriate level. Check with system manager to determine where it belongs.

MAGNETIC TAPE BASED SYSTEM STARTUP (FROM SYSDUMP TAPE)

COLDSTART:

- a. User files remain on disc.
- b. You get MPE and system configuration data from tape.

UPDATE:

- a. User files and configuration data remain on disc.
- b. You get MPE from tape.
- c. Replaces all drivers.

Central Processor Unit

RELOAD:

- a. You get MPE.
- b. User files and configuration data from tape.
- c. Nothing comes from disc.

SYSTEM BACKUP

During SYSDUMP procedures, the following responses can be entered after the DUMP DATE? prompt:

0	Copies everything from day zero
CR	Copies SYS account, PUB group, and some MPE files to stay operational
Current Date	Copies files changed on current date
Future Date	Copies accounting structure

STARTUP PROCEDURES SUMMARY

TYPE	SOURCE

* Certain information which may reside on the disc is checked for validity.

Central Processor Unit

ROM PCA JUMPER LOCATIONS

NOTE

The ROM PCA is loaded with ROM's that have a capacity of 2K words. Therefore, jumpers W5 through W8 are always installed in the four positions nearest the 2K marking as shown below.

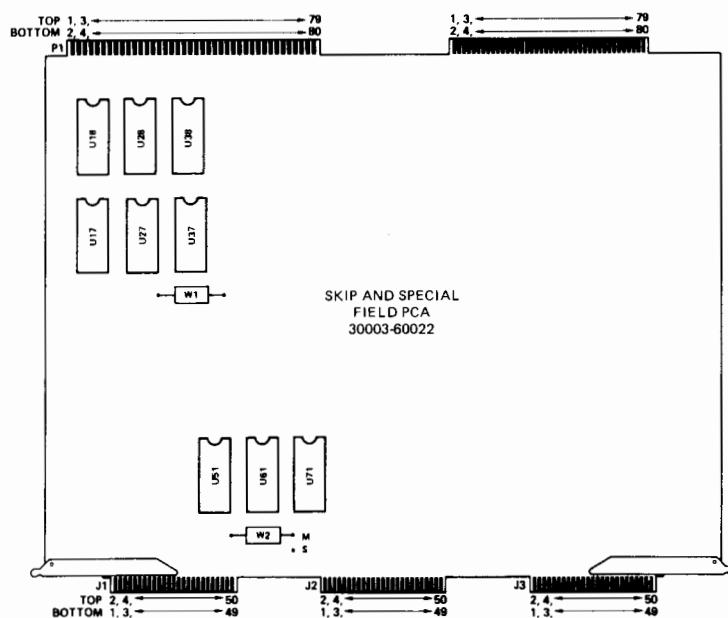

Reference: RTM

Central Processor Unit

SKIP AND SPECIAL FIELD PCA JUMPER LOCATIONS

NOTE

Sync jumpers W1 and W2 are always installed as shown below.

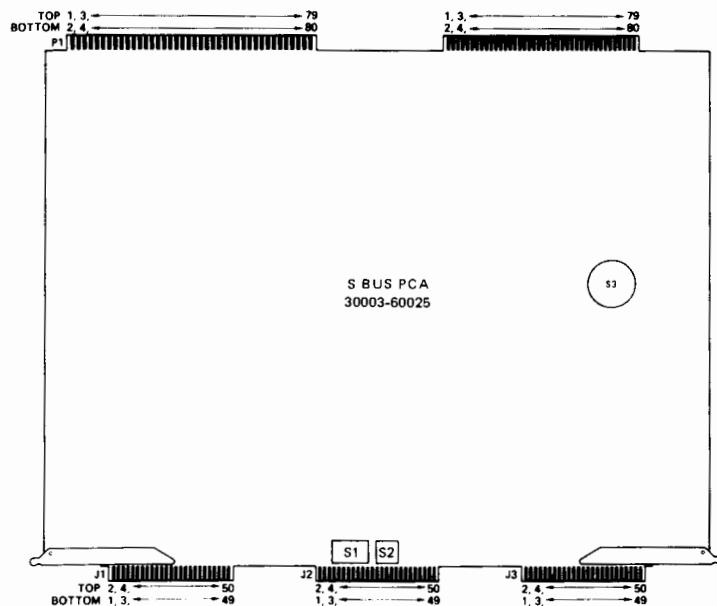

Reference: RTM

Central Processor Unit

S-BUS PCA SWITCH LOCATIONS

NOTE

Memory Size Switch S3 is set to agree with the total size of semiconductor memory in thousands of words as shown below. Memory Interleaving Switches S1 and S2 must be configured for non-interleaving (i.e., positions 1 through 4 of S1 closed and all positions of S2 open). For additional memory interleaving information, refer to the Reference Training Manual.

Central Processor Unit

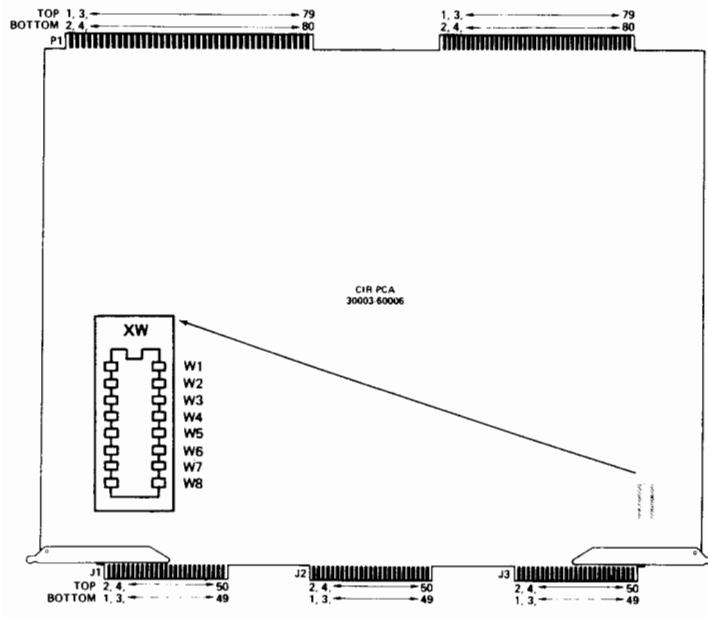

CIR PCA JUMPER LOCATIONS

NOTE

If the EIS PCA is not installed in the system, jumpers W1 through W8 are all installed on the CIR PCA as shown below. When the EIS PCA is installed, jumpers W1 and W8 must be removed. Removing W1 enables the floating point instructions and removing W8 enables the decimal instruction set.

When APL (Product Number HP 32105A) is installed on the EIS PCA, jumper W2 on the CIR PCA must be removed to enable the APL instructions.

When COBOL II (Product Number HP 32234A) is installed on the EIS PCA, jumper W4 on the CIR PCA must be removed to enable the COBOL II instructions.

Memory

MEMORY CONFIGURATIONS

BANKS	SYSTEM WORD CAPACITY	PCA'S REQUIRED			
		MCL	SMA	FLI	TOTAL
2	128K	1	1	1	3
4	256K	1	2	1	4
6	384K	1	3	1	5
8	512K	1	4	1	6
12	768K	2	6	1	9
16	1024K	2	8	1	11

NOTE

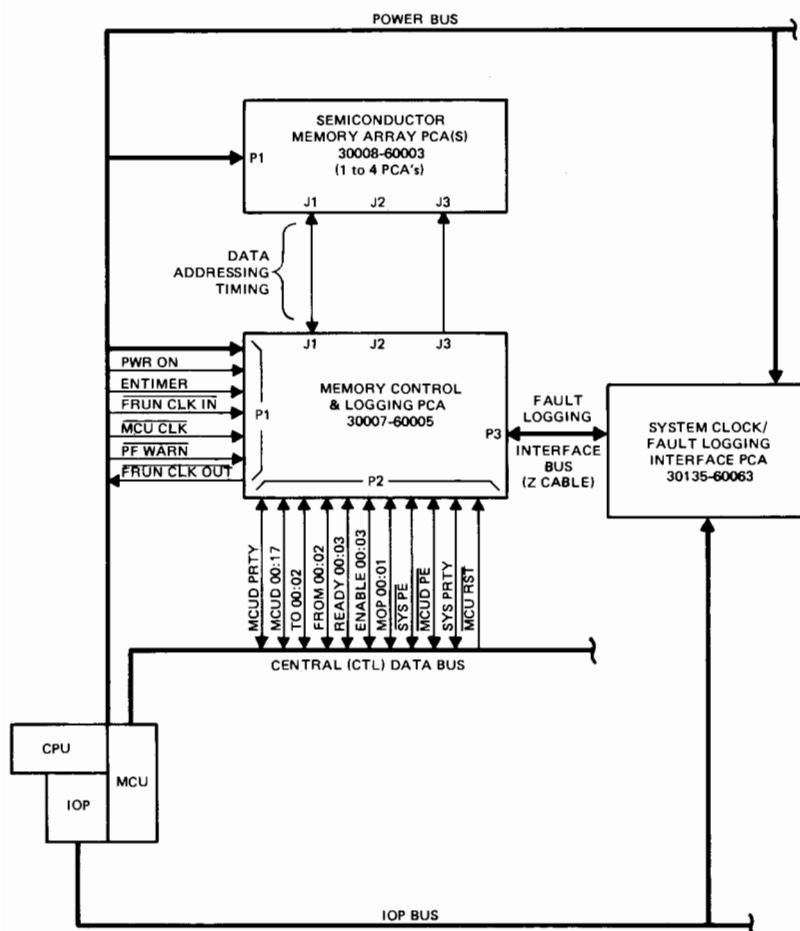

When changing memory configuration, check that the switches on the MCL, SMA, S-Bus, IOP, and Selector Channel Register PCA's are set to the proper memory size.

Memory has the following operating modes and specifications:

- * WRITE 700 nsec minimum cycle time.
- * READ 350 nsec access, 700 nsec cycle time.
- * NO OPERATION (NOP) 700 nsec cycle time.

MEMORY MODULE INTERFACE DIAGRAM

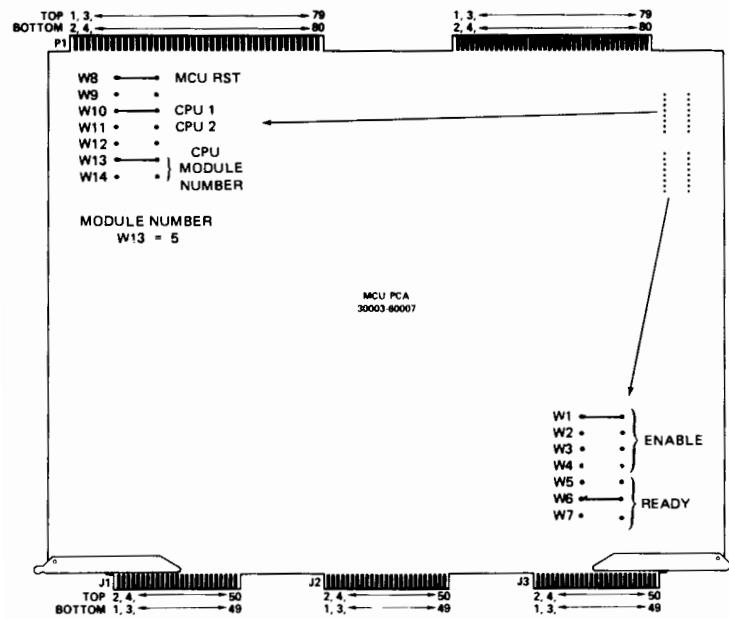

Reference: RTM

Memory

MCU PCA JUMPER LOCATIONS

NOTE

Jumpers W1 (ENABLE), W6 (READY 5), and W8 (MCU RESET) are always installed. The CPU must be designated as CPU number one and module number five by the insertion of jumpers W10 and W13, respectively as shown below.

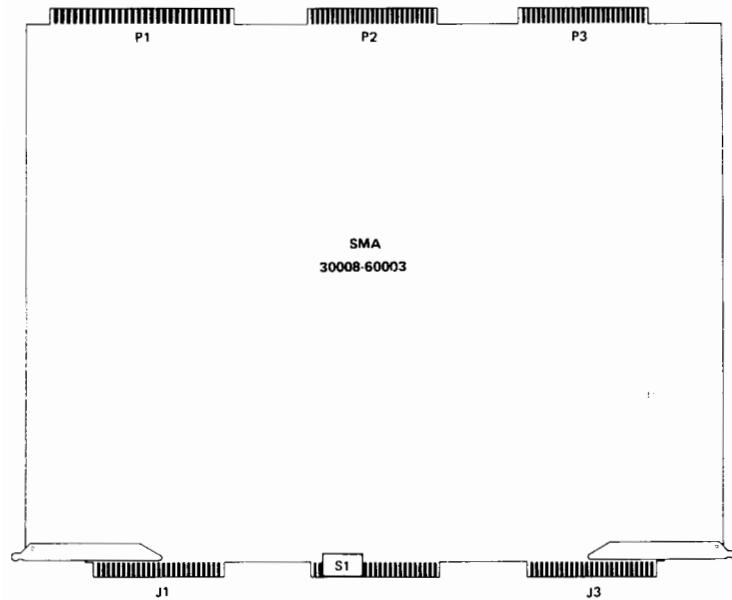

Reference: RTM

SMA PCA SWITCH LOCATION

NOTE

Each SMA PCA installed in the system must have switch S1 (SMA PCA SELECT) set to a position different from the positions selected by any other SMA PCA's associated with the same MCL PCA.

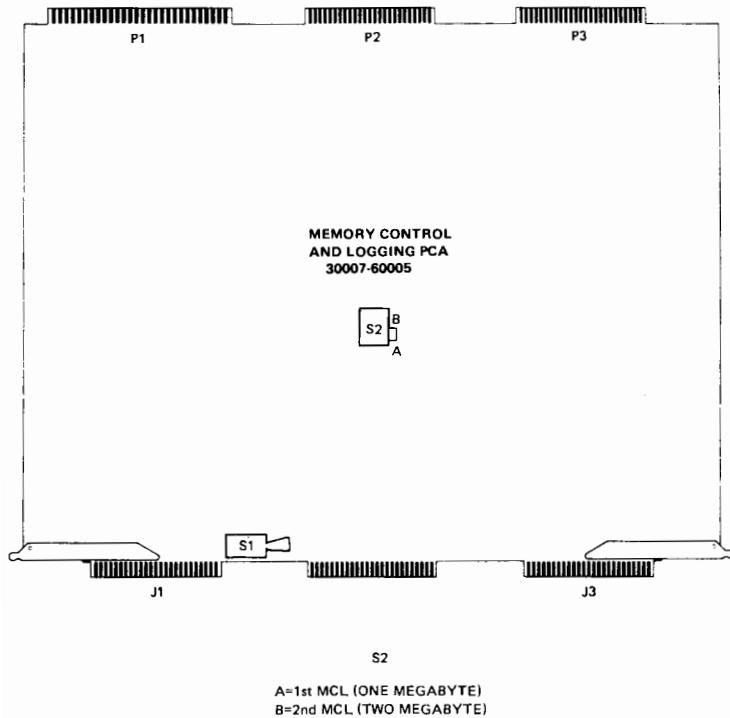

Reference: RTM

Memory

MCL PCA SWITCH LOCATIONS

NOTE

In systems with over 512K words of memory, switch S2 (MEMORY MODULE SELECT) is set to position A on one MCL PCA and to position B on the remaining MCL PCA. Switch S1 (ELA MANUAL CLEAR) clears the Error Logging Array.

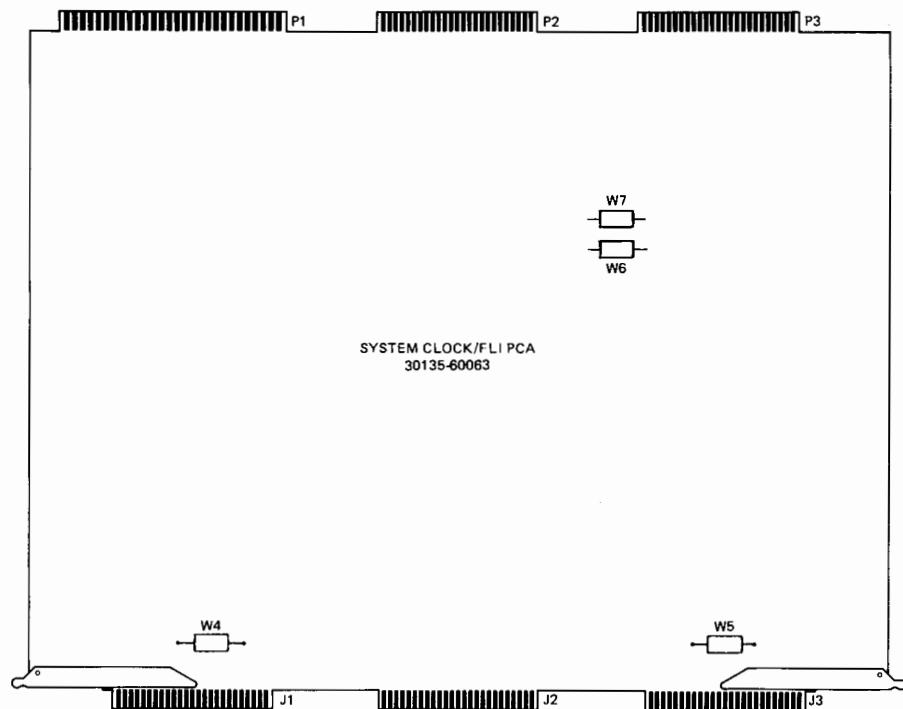

Reference: RTM

Memory

SYSTEM CLOCK/FLI PCA JUMPER LOCATIONS

NOTE

DRT 2 is hardwired on this PCA for the FLI and cannot be changed. Jumpers W6 and W7 are installed for system clock DRT 3 (positive logic used for DRT number).

Memory

ERROR CORRECTION

Refer to "Display Memory Logging Errors Function" in Section I of this manual for additional error logging information.

```
:HELLO FIELD.SUPPORT,HP32230
:FILE OUT;DEV=LP
:RUN MEMLOGAN.PUB.SYS
```

Typical MEMLOGAN Printout

ADDRESS			*ERROR TYPE			*ERROR COUNT
CONTROLLER	BOARD	ROW	TYPE	BIT	CHIP	
CONTROLLER A	0	1	CHECK	0	U198	2
		6	DATA	9	U103	13
		1	DATA	0	U19	4
		0	MULTIPLE BIT ERROR			1
	1	0	DATA	11	U149	3
		7	DATA	14	U172	2
		2	CHECK	5	U246	3
		3	CHECK	2	U219	1
CONTROLLER B	2	0	DATA	11	U143	3
		6	DATA	15	U187	4

*NOTES:

CHECK TYPE = Check Bit Error. Bit refers to failing check bit; C0 through C5.

DATA TYPE = Data Bit Error. Bit refers to failing data bit; 0 through 15.

D.E.W. TYPE = Forced Double Error Write. Indicated data parity error on data transmitted to memory.

MULTIPLE BIT ERROR TYPE = Error in more than one bit.

Error Count does not indicate the total number of times that an error occurred; it only indicates the total number of errors logged during successive memory log updates. The MEMTIMER utility program (MEMTIMER.PUB.SYS) is used to modify the time interval between successive memory log updates. The normal default interval is 60 minutes.

MULTIPLEXER CHANNEL PCA JUMPER LOCATIONS

NOTE

Jumpers W1 through W7 are Device Number jumpers. A logic "1" is represented by the absence of a jumper and a logic "0" is represented by the presence of a jumper. The Multiplexer Channel PCA's device number is normally %177 (no jumpers installed) as shown below.

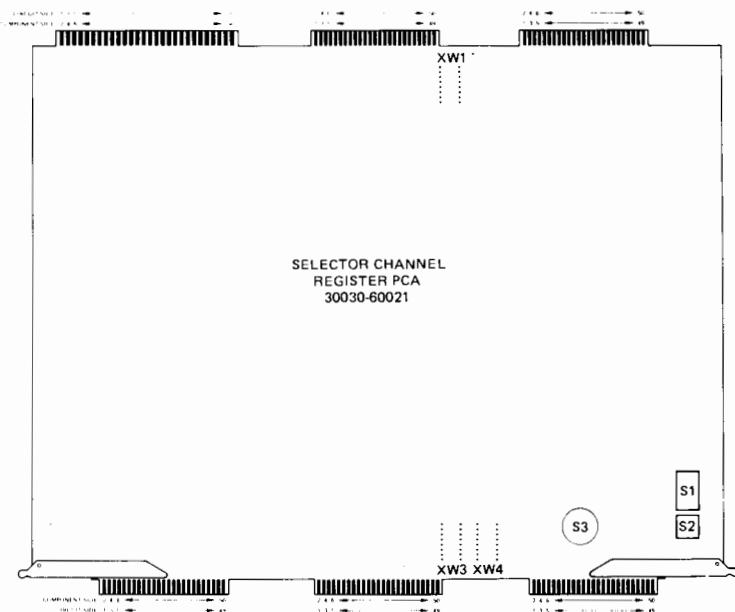

Reference: RTM

SELECTOR CHANNEL REGISTER PCA JUMPER AND SWITCH DESCRIPTIONS

Dual inline sockets XW1, XW3, and XW4 are used to select the channel number of the Selector Channel Register PCA. Installation of a jumper plug into one of the sockets determines the channel number as shown in the following illustration. Memory Size Switch S3 is set to agree with the total size of semiconductor memory in thousands of words as shown. Memory Interleaving Switches S1 and S2 must be configured for non-interleaving (i.e., positions 1 through 4 of S1 closed and all positions of S2 open). For additional memory interleaving information, refer to the Reference Training Manual.

SELECTOR CHANNEL CONTROL PCA INDICATORS

LED	SIGNAL NAME	DESCRIPTION
CR1 thru CR5	IOCW4 thru IOCWO	Order code from Register PCA
CR6	ACTIVE	An order is currently executing
CR7	WCRO	Word count rollover
CR8	DEVEND	Device end from device controller
CR9	XERR	An error occurred
CR10	RR	State of RR (return residue) flip-flop
CR11	END	State of END flip-flop
CR12	JUMP	State of JUMP flip-flop
CR13	CTRL	State of CTRLR flip-flop
CR14	CHAN SR	Service request from device controller
CR15	CHAN SO	Service Out from channel
CR16	CHAN ACK	Channel Acknowledge from device controller
CR17	FREEZE	Clock is frozen by a selected condition

SELECTOR CHANNEL CONTROL PCA SWITCHES

TRIGGER/FREEZE SELECTOR SWITCH S1. Switch S1 and standoff E2 (TRIG) provide the capability of triggering an oscilloscope each time a preselected condition occurs. Switch S1 can select one of eight orders or an error condition. For orders, the trigger occurs when the order begins to execute. A typical use of a selectable trigger might be to loop on an I/O program by means of a Jump Order while triggering on an order of interest.

NORMAL/FREEZE SWITCH S2. Switch S2 is used in conjunction with Switch S1 and the Error Logging Register during troubleshooting procedures. During normal system use, Switch S2 must be set to its normal position (opposite the FRZ position).

SELECTOR CHANNEL REGISTER PCA JUMPER AND SWITCH LOCATIONS

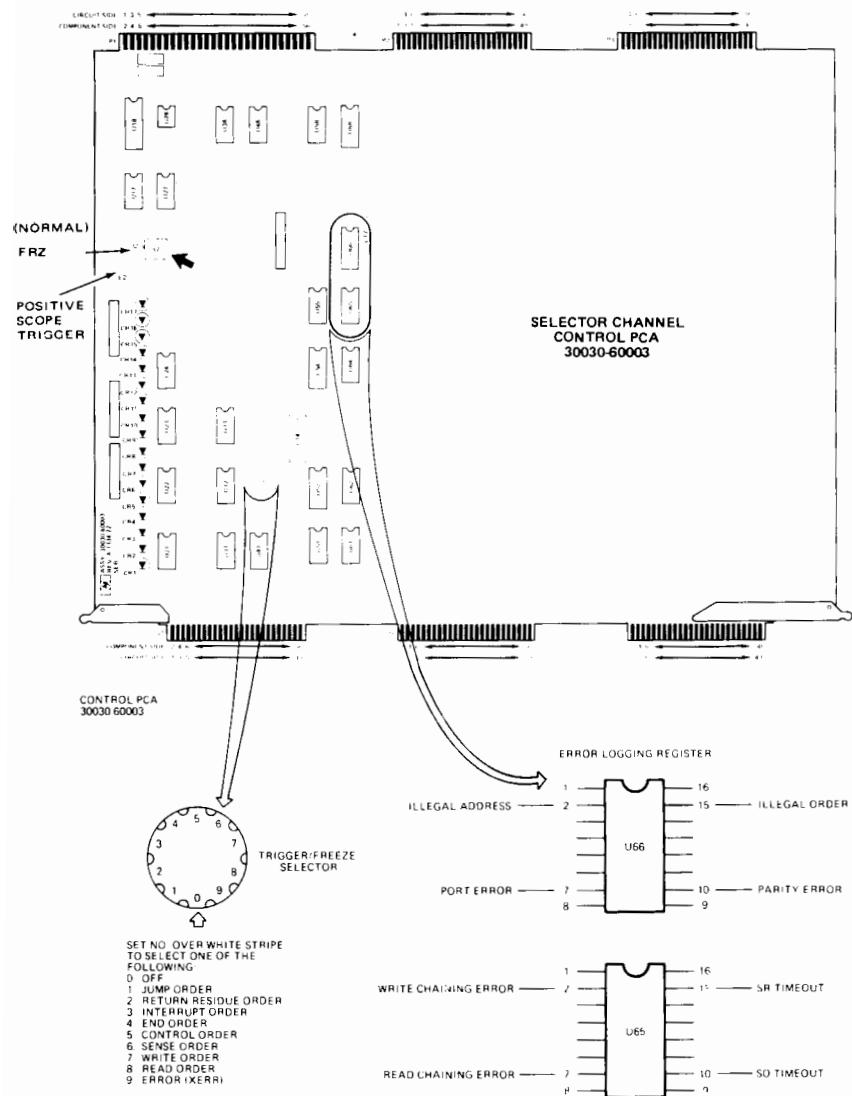

LED	SIGNAL NAME	DESCRIPTION
CR1 thru CR5	IOCW4 thru IOCWO	Order code from Register PCA
CR6	ACTIVE	An order is currently executing
CR7	WCRO	Word count rollover

CR9	XERR	SELECTOR CHANNEL REGISTER PCA REGISTER ERROR occurred 30030-60021
CR10	RR	State of RR (return residue) flip-flop
CR11	END	State of END flip-flop
CR12	JUMP	State of JUMP flip-flop
CR13	CTRL	State of CTRLR flip-flop
CR14	CHAN SR	Service request from device controller
CR15	CHAN SO	Service Out from channel
CR16	CHAN ACK	Channel Acknowledge from device controller
<u>CHANNEL NUMBER</u>	<u>MEMORY SIZE (WORDS)</u>	
XW1 - CHANNEL 1	S3	Clock is frozen by a selected condition
XW3 - CHANNEL 3	1-128K	S2
XW4 - CHANNEL 4	2-256K	S1
(SELECTOR CHANNEL 2 NOT AVAILABLE)	3-384K	1-4 OPEN
	4-512K	1-4 CLOSED
	6-1024K	5-7 OPEN
SELECTOR CHANNEL CONTROL PCA SWITCHES		

14-1996-2 TRIGGER/FREEZE SELECTOR SWITCH S1. Switch S1 and standoff E2 (TRIG) provide the capability of triggering an oscilloscope each time a preselected condition occurs. Switch S1 can select one of eight orders or an error condition. For orders, the trigger occurs when the order begins to execute. A typical use of a selectable trigger might be to loop on an I/O program by means of a Jump Order while triggering on an order of interest.

NORMAL/FREEZE SWITCH S2. Switch S2 is used in conjunction with Switch S1 and the Error Logging Register during troubleshooting procedures. During normal system use, Switch S2 must be set to its normal position (opposite the FRZ position).

Reference: RTM

SELECTOR CHANNEL CONTROL PCA COMPONENT LOCATIONS

USING THE TRIGGER/FREEZE FEATURE

The trigger/freeze feature can only be used when the HP 30354A Maintenance Panel is connected to the system. To use this feature, proceed as follows.

- a. Set TRIGGER/FREEZE SELECTOR Switch S1 to the position corresponding to the desired condition.
- b. Set NORMAL/FREEZE Switch S2 to FRZ (freeze).
- c. Initiate program execution. The selector channel operation will freeze when the selected condition is decoded.
- d. Set the HP 30354A Maintenance Panel for single-cycle operation.
- e. Set NORMAL/FREEZE Switch S2 to its normal (opposite FRZ) position.
- f. Single-cycle the system through the execution sequence for the desired order while observing the Selector Channel Control PCA's various LED's.

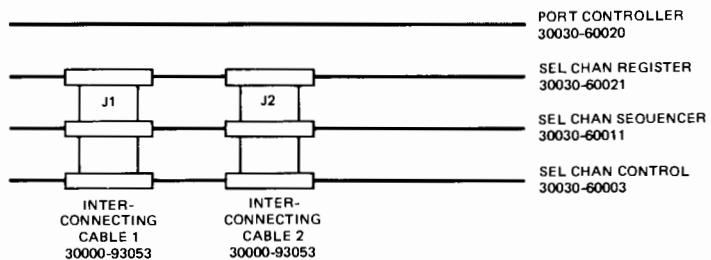

SELECTOR CHANNEL CONTROL PCA ERROR LOGGING REGISTER

The Error Logging Register provides a means for determining the type of error that prematurely terminates the execution of an I/O program. When an error occurs, the error type sets a corresponding bit in the Error Logging Register. To observe the Error Logging Register contents, proceed as follows:

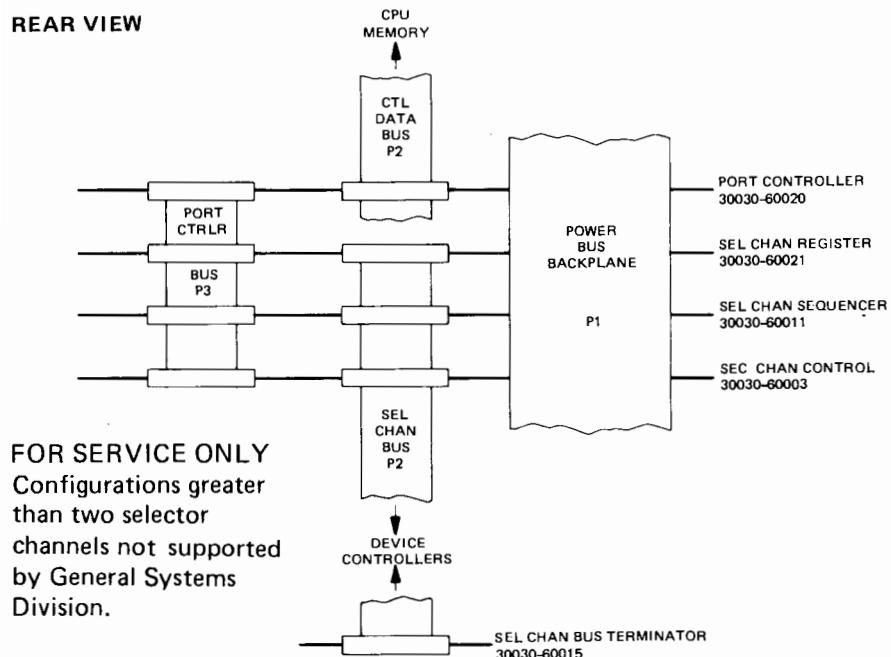

- a. Observe the Error Logging Register contents with a logic probe or clip.
- b. Set TRIGGER/FREEZE SELECTOR Switch S1 to position 9.
- c. Set NORMAL/FREEZE Switch S2 to FRZ (freeze). The Error Logging Register contents are cleared immediately after an error occurs during the clear sequence. Therefore, the register contents are valid when the error occurs causing the freeze.

SELECTOR CHANNEL CABLING CONFIGURATION

REAR VIEW

FOR SERVICE ONLY
 Configurations greater
 than two selector
 channels not supported
 by General Systems
 Division.

SELECTOR CHANNEL MAINTENANCE PCA (SCMB) DESCRIPTION

The SCMB is a maintenance aid for servicing the selector channel and multiplexer channel. Under software control (usually the selector channel diagnostic), the SCMB can exercise all selector channel data paths and control circuits. All I/O program orders can be executed and device dependent sequences such as conditional jump, device end, and clear interface can be exercised selectively. Also, device timeout conditions can be simulated causing a timeout error in the selector channel.

SCMB JUMPER DESCRIPTIONS

The XW1 jumpers select whether the SCMB is to be used with the selector channel or the multiplexer channel. If the plug-in socket (contains two jumper wires) is installed in XW1 so that it is aligned with the SC placarding, the SCMB is enabled for use with the selector channel. If the plug-in socket is installed so that it aligned with MX, the SCMB is enabled for use with the multiplexer channel.

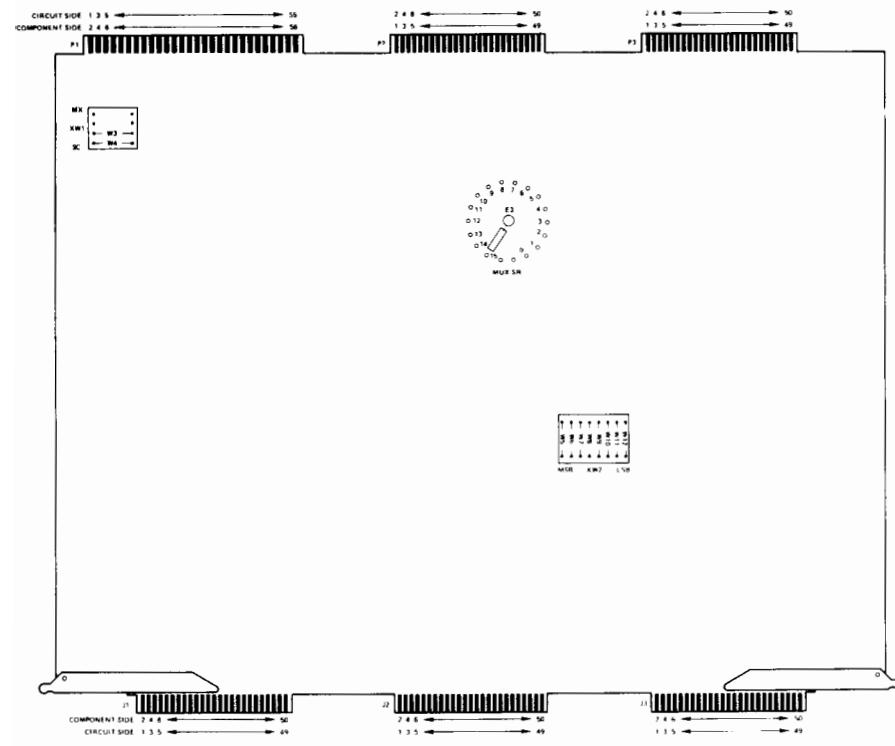

NOTE

When XW1 is configured for multiplexer channel use (jumpers aligned with MX) and the SCMB is installed in the multiplexer channel, the selector channel diagnostic is used to verify the operation of the SCMB.

The MUX SR jumper selects a service request number when the SCMB is used with a multiplexer channel. This 16-position jumper should be installed to provide a service request number not used by any other device controller in the system. Service request number zero is reserved for the SCMB.

The XW2 jumpers select the SCMB device number. An installed jumper wire selects a "0" in that position. Use a device number not already assigned.

SCMB JUMPER LOCATIONS

SCMB SELECTOR CHANNEL INSTALLATION

To install the SCMB in a selector channel, proceed as follows:

- a. Set the DC POWER LOGIC switch to DISABLE.
- b. Ensure that the SCMB XW1 jumpers are aligned with SC.
- c. Refer to the System Support Log and ensure that the selected SCMB device number is not used by any other device.
- d. Install the SCMB in an empty slot on the selector channel bus for the channel to be used.
- e. Install the interrupt poll for the SCMB.
- f. Set the DC POWER LOGIC switch to ENABLE.

SCMB MULTIPLEXER CHANNEL INSTALLATION

To install the SCMB in a multiplexer channel, proceed as follows:

- a. Set the DC POWER LOGIC switch to DISABLE.
- b. Ensure that the SCMB XW1 jumpers are aligned with MX.
- c. Refer to the System Support Log and ensure that the selected SCMB device number is not used by any other device.
- d. Install the SCMB in an empty slot on the multiplexer channel bus.
- e. Install the interrupt poll for the SCMB.
- f. If a second SCMB is to be installed, repeat steps a through e.
- g. Set the DC POWER LOGIC switch to ENABLE.

SCMB VERIFICATION

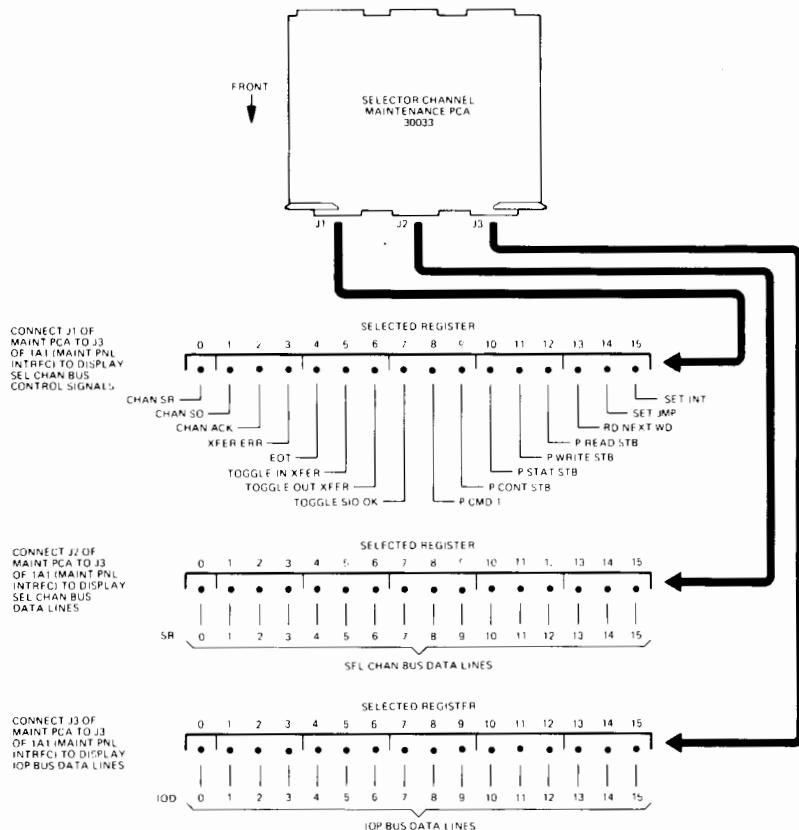

To verify the SCMB, perform the following procedure.

OPERATOR ACTION/COMMENTS	CONSOLE MESSAGE
Install SCMB XW1 jumpers in the MX positions.	
Install SCMB in multiplexer channel and ensure that DRT number and interrupt poll are correctly wired.	
Cold load selector channel diagnostic (D429) from the stand-alone diagnostic tape. Press RETURN.	D100 HP3003OB SELECTOR CHANNEL DIAG (D429X.YY.Z) Q104 SELECT OPTIONS
X=Version YY=Update Level Z=Fix Level Set SYSTEM SWITCH REGISTER bit 0 to off. Press RETURN.	Q110 SELECT SECTION OPTIONS
Press RETURN.	Q101 SET MAINT CARD DEV NUM?
Enter in decimal the DRT number of the SCMB. Press RETURN.	Q102 SET TIMER/CONSOLE DEV NUM?
Enter in decimal the number of the system timer (usually 3). Press RETURN.	Q108 ENTER UPPER BANK # (DECIMAL)=
Enter in decimal the number of the highest memory bank in the system. Press RETURN.	
Enter in octal the highest memory address available. Press RETURN.	Q105 ERR PRINT LIMIT?
Enter in decimal the maximum number of error messages to be received. Press RETURN.	D110 DIRECT I/O TEST D127 DIRECT I/O TEST COMPLETED D130 CONTROL ORDER TEST

IOP/Channels

DISPLAYING SCMB SIGNALS

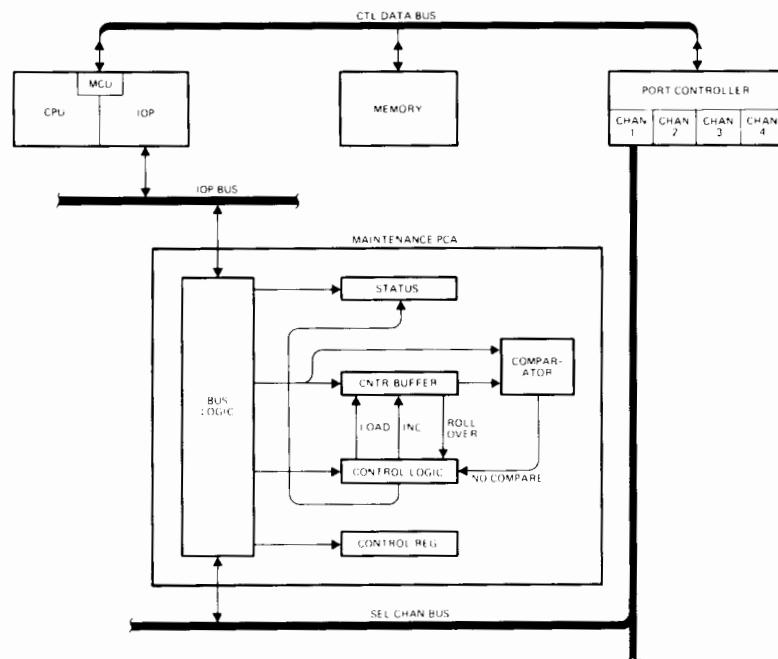

The state of pertinent SCMB signals can be displayed on the maintenance panel by making the connections shown below with a flat cable and then setting the maintenance panel CLOCK switch to INHIBIT. It should be noted that although the system can be permitted to run in the free-run mode with this setup, that the display is valid only in the single-cycle mode.

SCMB STATE DISPLAY

SCMB PROGRAMMING

Like any device controller, the SCMB is programmed through the use of direct I/O instructions from the CPU/IOP and through I/O program orders executed by the selector channel as shown in the block diagram below. SCMB operation is initially configured when a control word is issued by a direct control I/O instruction. To initiate execution of an I/O program (and therefore channel operation), an SIO instruction is issued to the SCMB. The SCMB also provides a 16-bit status word for various SCMB and selector channel operating conditions.

SCMB BLOCK DIAGRAM

IOP/Channels

I/O INSTRUCTIONS. The following is list of applicable I/O instructions and their effect on the SCMB.

SIN Instruction - Sets the SCMB Interrupt Request flip-flop.

CIO Instruction - Loads a control word from TOS into the SCMB Control Register.

SIO Instruction - Initiates I/O program execution if the channel is inactive. If the channel is active, the SIO instruction is rejected.

WIO Instruction - Loads a data word from TOS into the SCMB Counter/Buffer.

RIO Instruction - Sends contents of the Counter/Buffer to TOS.

TIO Instruction - Returns the SCMB status word to TOS.

SMSK Instruction - No effect. The SCMB has no Mask flip-flop.

I/O PROGRAM ORDERS. The following is a list of applicable I/O program orders and their effect on the SCMB.

Control - Selects operational states/test modes of the SCMB.

Write - If IOCW bit 11 is "0", loads a data word from memory into SCMB Counter/Buffer. If bit 11 is "1", compares data word from memory with Counter/Buffer contents.

Read - Sends contents of the SCMB Counter/Buffer to memory.

End - Returns the SCMB status word to the End order IOAW location and terminates I/O program execution. If bit 4 is "1", an interrupt occurs.

Interrupt - Sets the SCMB Interrupt Request flip-flop.

Sense - Returns the SCMB status word to the Sense order IOAW location in memory.

Jump - If bit 4 of the order is "1" and bit 2 of the current IOCW is "1" or if bit 4 of the current control word is "0" (i.e., set jump met), this instruction causes an I/O program jump to occur.

Return Residue - If bit 4 of the IOCW is "0", causes the residue of the count to be returned to the IOAW.

Set Bank - If bit 4 of the IOCW is "1", loads the Bank Register for that device with IOAW bits 14 and 15.

CONTROL WORD. A control word can be issued to the SCMB through a direct control I/O instruction or through an I/O program control order. If a control order is used, the control word is located in the control order IOAW location (the control order IOCW is ignored by the SCMB). The control word is stored in the SCMB Control Register. The following is a list of control word bit functions and their effect on the SCMB.

Master Reset Bit 0. If "1", issues a reset signal to the SCMB which clears the Control Logic, Control Register, and Counter/Buffer. If the channel is active (i.e., SIO ENABLE =0), then a clear interface (i.e., REQ) is issued to the channel. This feature can be used to stop a runaway channel or another device controller's I/O program execution.

Reset Interrupt Bit 1. If "1", clears the SCMB Interrupt Request flip-flop.

Set Jump Met Bit 2. If "1", sets the SCMB Jump flip-flop. Then, if the selector channel executes a conditional jump order, the SCMB returns the Jump Met signal to the channel which causes an I/O program jump to occur.

Device End Bit 3. If "1", causes the SCMB to issue the Device End signal to the channel at the beginning of any data transfer. This results in no data transferred between the channel and the SCMB.

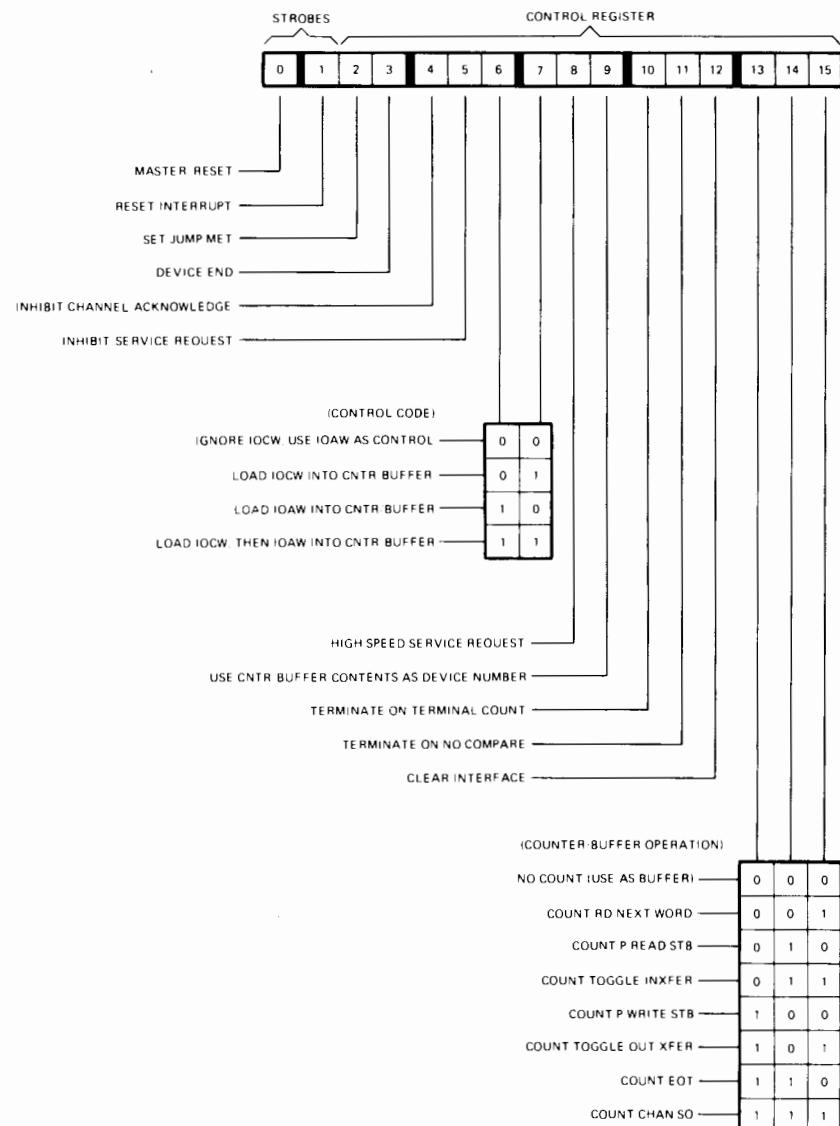

Inhibit Channel Acknowledge Bit 4. If "1", causes the SCMB to inhibit the Channel Acknowledge signal to the channel, following the current control order. This results in an SO Timeout error in the channel if the channel timers are enabled.

Inhibit Service Request Bit 5. If "1", causes the SCMB to inhibit the Channel Service Request signal to the channel. This results in an SR timeout error in the channel if a subsequent Read, Write, or Control order is executed.

Control Code Bits 6 and 7. These bits define how the two control words sent during channel execution of a Control order are used. The normal mode loads the IOAW into the Control Register to be used as a control word. The other modes load either or both the IOCW and IOAW into the Counter/Buffer leaving the Control Register contents unchanged.

High Speed Service Request Bit 8. If "1", overrides the SCMB service request delay (normally 200 kHz) to force continuous CHAN SR signals (when required) to the channel. The resulting transfer rate will be approximately 950 kHz outbound and 1140 kHz inbound.

SCMB CONTROL WORD FORMAT

Device Number Bit 9. If "1", supplies the Counter/Buffer content as the device number at I/O program initiation instead of the hardwired device number. By preloading the Counter/Buffer using a direct WIO instruction, an I/O program can be executed to any device number.

Terminate On Terminal Count Bit 10. If "1", causes a Device End or clear interface (i.e., REQ) to be issued to the channel if the Counter/Buffer contents rollover (i.e., past count capacity). Whether Device End or clear interface is issued is determined by the state of bit 12.

Terminate On No Compare Bit 11. If "1", causes the contents of the Counter/Buffer to be compared with data words issued to the SCMB during channel execution of a Write order. (Normally, data received during execution of a Write order is loaded into the Counter/Buffer. When bit 11 is "1", the Counter/Buffer contents remain unchanged.) If a compare failure occurs, the SCMB issues either a Device End or clear interface (i.e., REQ) to the channel depending on the state of bit 12.

Clear Interface Bit 12. If "1", causes a clear interface (i.e., REQ) to be issued to the channel if either of the conditions controlled by bits 10 or 11 occur. If "0", causes a Device End to be issued if either condition occurs.

Counter/Buffer Operation Bits 13-15. These bits control the operation of the Counter/Buffer. When used as a buffer, the Counter/Buffer is loaded with data words received during channel execution of a Write order (unless bit 11 is "1"). The buffer contents are sent to the channel as data during channel execution of a Read order. Upon receipt of an I/O Reset signal, the Counter/Buffer and Control Word Storage Registers are cleared. Therefore, the initial operating state of the SCMB is as follows:

The Counter/Buffer contents equal zero.

If a Control order is executed, the Control order IOAW will be used as a Control word.

The SCMB wired device number will be sent if an SIO instruction is executed to the SCMB.

The Counter/Buffer will be used as a buffer.

IOP/Channels

STATUS WORD. The status word results from various signals and flip-flops on the SCMB. The conditions reported by the status word are reset each time I/O program execution is initiated by an SIO instruction. Transfer related functions (e.g., no compare) are reset at the beginning of data transfers. The following is a list of the status word bits and their definitions.

SIO Ok Bit 0. If "1", the SCMB is not currently executing an I/O program and the channel is inactive.

RIO/WIO Ok Bit 1. This bit is always a "1".

Interrupt Pending Bit 2. If "1", the SCMB is attempting to interrupt the CPU.

Interrupt Active Bit 3. If "1", the SCMB interrupt circuits are currently in the active state.

Transfer Error Bit 4. If "1", the channel has sent the Transfer Error signal. Bit 4 is cleared by the next SIO instruction or I/O Reset.

SIO Enable Bit 5. If "1", the channel is asserting the SIO ENABLE signal (i.e., channel inactive).

Device End Bit 6. If "1", the SCMB has asserted the Device End signal to the channel. Bit 6 is cleared at the beginning of a new data transfer, the next SIO instruction, or an I/O Reset.

EOT Bit 7. If "1", the channel has asserted the End Of Transfer signal to the SCMB. Bit 7 is cleared at the beginning of a new data transfer, the next SIO instruction, or an I/O Reset.

IN XFER FF Bit 8. If "1", the most current data transfer operation was a Read order.

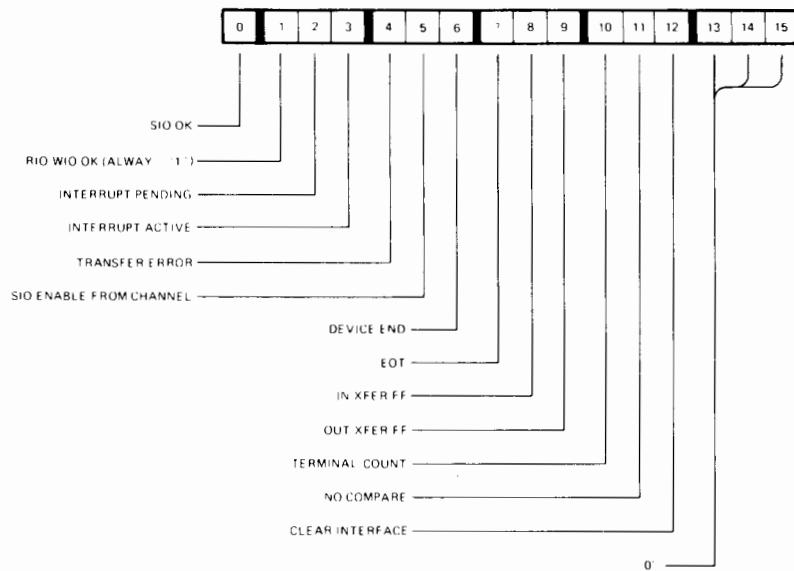

OUT XFER FF Bit 9. If "1", the most current data transfer operation was a Write order.

Terminal Count Bit 10. If "1", a condition counted by the Counter/Buffer caused a rollover (i.e., past count capacity). Bit 10 is cleared at the beginning of a new data transfer, the next SIO instruction, or an I/O Reset.

No Compare Bit 11. This bit is enabled if control word bit 11 is "1". If this bit is "1", a data word received from the channel during Write order execution did not match the word contained in the Counter/Buffer. Bit 11 is cleared at the beginning of a data transfer by the next SIO instruction to the SCMB or by an I/O Reset.

Clear Interface Bit 12. If "1", the SCMB has asserted the Clear Interface signal (i.e., REQ) to the channel. Bit 12 is cleared at the beginning of the next SIO instruction or by an I/O Reset.

TERM TYPES

TERM TYPE? This question is asked only if TYPE is 16. To specify a default terminal type to be used at log-on, enter a number as follows:

TERMINAL TYPE	DESCRIPTION
0	HP 2749B (ASR-33 EIA-compatible) Terminal (10 cps).
1	ASR-37 Teleprinter Terminal with Paper Tape Reader/Punch (10 cps).
2	ASR-35 EIA-compatible Terminal (10 cps).
3	Execuport 300 Data Communications Transceiver Terminal (10/15/30 cps).
4	HP 2600A or Datapoint 3300 Keyboard-Display Terminal (10/15/30/60/120/240 cps).
5	Memorex 1240 Communication Terminal (10/15/30/60 cps). Terminal must use even parity-check option.
6	HP 2762A/B (General Electric Terminate 300 or 1200), or Data Communications Terminal, Model B (10/15/30/120 cps) with Paper Tape Reader/Punch, Option 2. Terminal must be equipped for "ECHO PLEX".
7 & 8	Reserved
9	HP 2615A Terminal (Beehive MiniBee) (10/15/30/60/120/240 cps.).
10	HP 2621A/P, HP 2640A/B, HP 2641A, HP 2644A, HP 2645A, or HP 2648A. Character Mode or full program control of block mode transmission. (10-240 cps.)
11	HP 2621/40/41/44/45. Allows user to use block mode without program control of block mode transmission. Requires to position cursor before pressing ENTER. Recommended for speeds exceeding 30 cps when you expect to switch between character mode and block/line mode. May not be used in block/page mode. (10-240 cps.)
12	HP 2645K Katakana/Roman Data Terminal (8-bit)

I/O System Configuration

TERM TYPES (Continued)

TERMINAL TYPE	DESCRIPTION
13	TELENET message switching network.
14	Multipoint Terminal and Multipoint Supervisor.
15	HP 2635A Printer Terminal (8-bit environment)
16	HP 2635A Printer Terminal (7-bit with parity)

I/O System Configuration

USING THE :SYS DUMP COMMAND

The :SYS DUMP command can be entered at any time during a session. Prior to entering the command, a file reference to a serial storage device must be made. (If a disc drive is used, it must be an HP 7920 or HP 7925.) A file reference to a list device can also be made (optional).

NOTE

:SYS DUMP requires System Supervisor (OP) capabilities.

To begin dialog with the Configurator, enter:

```
:FILE DUMP;DEV=TAPE  
:SYS DUMP*DUMP
```

You will be asked if you want to make any configuration changes. If your reply is NO, the Configurator copies the running system to the specified device (mag tape in the above example). If your reply is YES, the Configurator continues its interactive dialog with you.

If \$NULL is specified as the output file, SYS DUMP will not write to any device. This may be useful in displaying the current system configuration.

DC POWER SUPPLY SPECIFICATIONS

LED and Test Point	Voltage Range		Power Supply Source	Supplies Dc Voltage To
	Minimum	Maximum		
+15	+14.5V	+16.5V	HP 63312F-P02	Card Cage 3-6
+12B	+11.9V	+12.1V	HP 61315D-P07	Card Cage 2-6
+5 CPU	+5.17V	+5.17V	HP 62605M-P41	Card Cage 1-2
+5B	+5.0V	+5.25V	HP 61315D-P07	Card Cage 2
+5-V1	+5.0V	+5.25V	HP 63312F-P02	Card Cage 3
+5-V2*	+5.0V	+5.25V	HP 63312F-P09	Card Cage 5
+5-V3*	+5.0V	+5.25V	HP 62605M-P41	Card Cage 5-6
TEMP	N/A	N/A	See Note	See Note
-5B	-5.0V	-5.25V	HP 61315D-P07	Card Cage 2-6
-5	-4.5V	-5.5V	HP 63312F-P09	Card Cage 3-6
-15	-14.5V	-15.5V	HP 63312F-P02	Card Cage 3-6

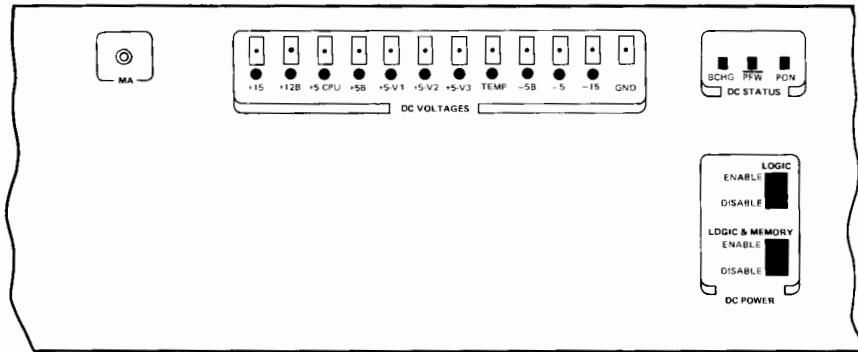

Note: The sense line for TEMP goes through a thermal switch in the equipment cabinet fan panel to +5-V2 in Card Cage No. 4. High temperatures open the thermal switch which simulates a power failure. If +5-V2 fails, the +5-V2 and TEMP LED's may both be lighted. However, the TEMP LED may remain lighted with the +5-V2 LED not lighted.

* On the standard 1-bay model, +5-V2 is internally connected to +5-V3. If +5-V2 fails, one or both +5-V2 and +5-V3 LED's may be lighted.

Reference: RTM

Power Distribution

POWER SUPPLY CONTROL AND DISPLAY ASSEMBLY

If the DC POWER LOGIC switch is set to DISABLE, a power failure is simulated so that the contents of memory will not be destroyed and first the PFW indicator and then the PON indicator will no longer be lighted. In addition, the DC VOLTAGES LED's will be reset to their lighted status.

When the DC POWER switches are set to ENABLE, the PFW indicator will light immediately if the system's input AC power is within specifications. After approximately one or two seconds, the PON indicator will light if all the system's DC voltages are present. If the PON indicator does not light, one or more of the DC voltages has failed and the DC VOLTAGES LED(s) that is lighted indicates the DC voltage that has failed. If this occurs, all power supplies except memory backup are shut down and their supply voltages are not available at the DC VOLTAGES test points.

If one or more of the DC voltages fail during normal system operation, the PON indicator will no longer be lighted and the faulty DC voltage(s) will be indicated by the lighted DC VOLTAGES LED(s). The PFW indicator will remain lighted.

The shutdown circuits of the Power Supply Control PCA can be disabled either by jumpering pins E5 and E8 on the PCA or by jumpering the Power Supply Control and Display Assembly MA (Maintenance Aid) and GND (Ground) test points. If a suspected power supply operates properly when these circuits are disabled, then the trouble is probably due to a malfunction in the Power Supply Control PCA and not in the power supply.

Reference: RTM

Power Distribution

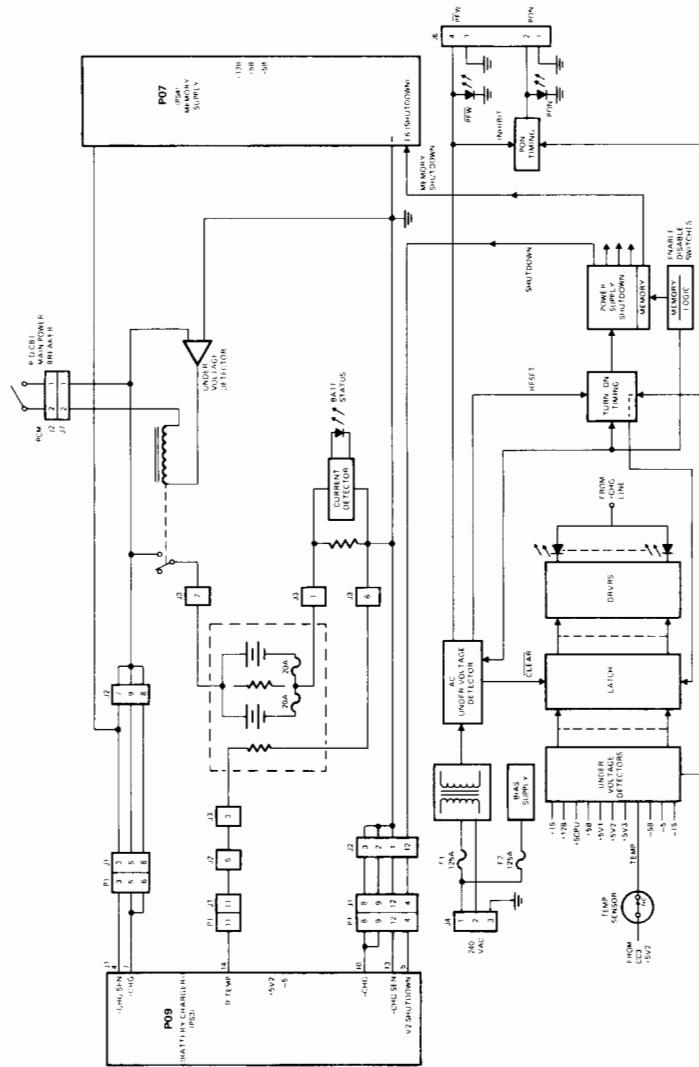

DC STATUS/DC POWER INDICATORS AND SWITCHES

Indicator or Switch	Function
DC STATUS BCHG Indicator	When fully lighted, indicates that the system's battery is fully charged. When slowly blinking, indicates that the battery is charging. When rapidly blinking, indicates that the battery is discharging. When not lighted, indicates that the battery is completely discharged or that the battery is not installed in the system.
DC STATUS PFW Indicator	When lighted, indicates that the system's input AC power is within specifications. When not lighted, indicates that the AC power has dropped below specifications and that DC power from the power supplies may begin to decay.
DC STATUS PON Indicator	When lighted, indicates that AC power is applied to the power supplies and that the power supplies are operating properly. When not lighted, indicates that one or more power supplies are not operating properly or that the DC voltages from the power supplies has begun to decay due to loss of input AC power.
DC POWER LOGIC Switch	When set to DISABLE, removes DC power from all PCA's except memory to permit removal and replacement of the I/O and CPU PCA's without destroying the contents of memory. When set to ENABLE, applies DC power to all PCA's except memory PCA's.
DC POWER MEMORY Switch	When set to DISABLE, removes all DC power from all PCA's. When set to ENABLE, applies DC power to all PCA's provided that the LOGIC switch is also set to ENABLE.

Power Distribution

BATTERY, PON, AND PFW CIRCUITS

Power Distribution

BATTERY CARE

ENVIRONMENT

The useful life of the battery is shortened if it is exposed to prolonged excessive heat or cold. Deterioration is greatest at temperatures over 60 degrees Centigrade or less than -20 degrees Centigrade. When the battery is being charged, cold temperatures hinder recovery and warm temperatures (approximately 35 to 40 degrees Centigrade) speed recovery.

SHELF LIFE

Shelf life is defined as storage life whether the battery is stored on a shelf or installed in an unused system. Typically, a battery stored on a shelf at room temperature will lose 50 percent of its charge in six months.

DISCHARGED BATTERY

A discharged battery has an extremely short life. Therefore, leaving a battery in a discharged state is by far the most frequent and serious cause of cell damage. Some degrees of cell damage are as follows:

- a. A discharged cell left for one or two days will probably begin to accept a charge within a few seconds or minutes.
- b. A discharged cell left for several weeks may take several days to begin to accept a charge. It will charge somewhat slower than normal, but will eventually become fully charged after one or two days.
- c. A discharged cell left for six months or longer may never accept a charge or, if it does, it will be after several weeks of continuous charging.

RESTORING DAMAGED CELLS

When a fully discharged cell is left for a week or two, it will look almost like an open circuit to the charging source. Therefore, a neglected battery pack in the system will appear as a fully charged battery when first turned on. The charging current detector detects no charging current and immediately indicates a fully charged condition. The battery backup capability in this case is nonexistent. The battery pack can be restored if put on a constant-current-limited power supply (0.15 to 0.25 amperes) with the charging voltage set to 150 percent of the normal float voltage. Once the battery starts to accept the charge, apply 130 to 150 percent of its ampere-hour capacity. The cells used in the battery pack are rated at 5.0 ampere-hours.

Power Distribution

SHIPPING

It is recommended that the connector leads of the battery pack be wrapped with electrical tape or some other non-conducting material when the battery pack is to be shipped or stored to prevent accidental shorting.

ARE SHOWN IN PARENTHESIS.

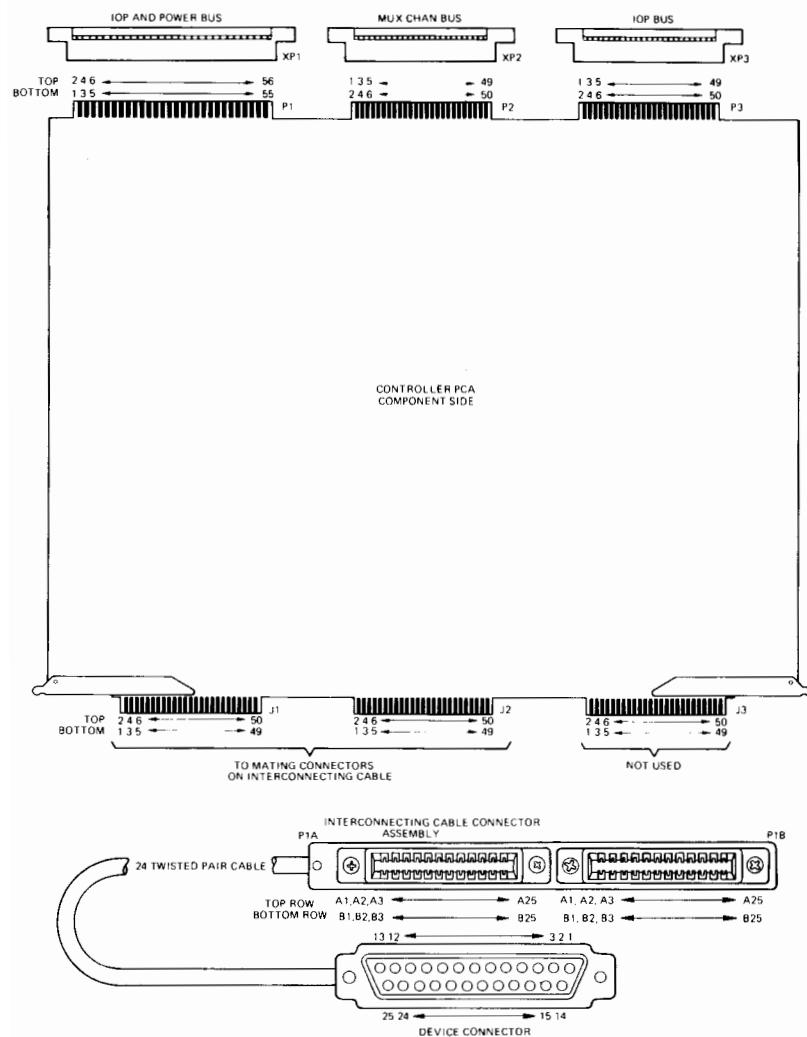

HSI STATUS WORD FORMAT

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
---	---	---	---	---	---	---	---	---	---	----	----	----	----	----	----

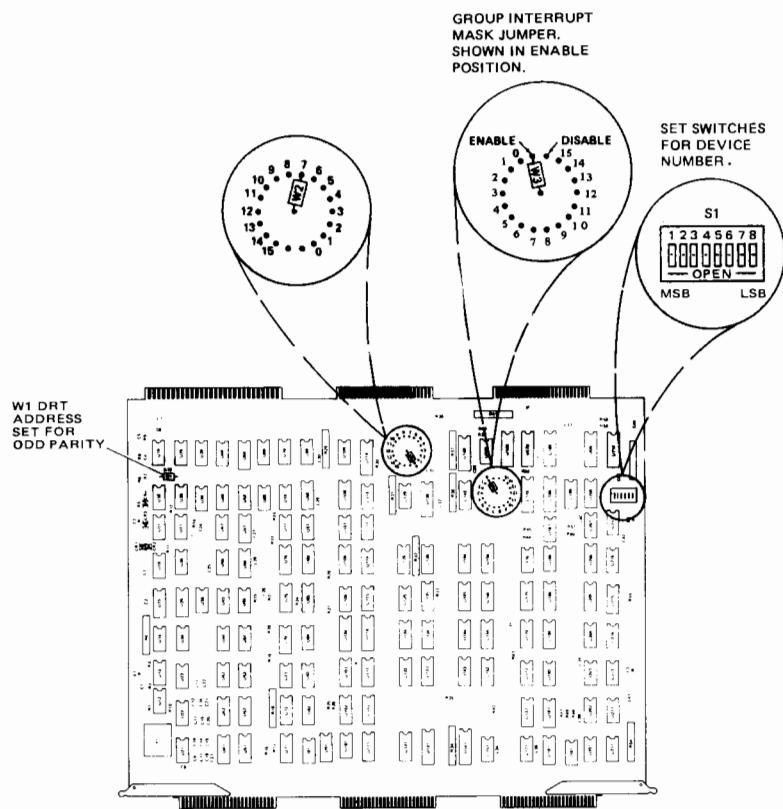

- Bit 0 SIO OK. A logic 1 indicates the HSI PCA is ready to execute an SIO program. A logic 0 indicates an SIO program is being executed.
- Bit 1 Read/Write OK. A logic 1 indicates the receive or transmit section is not busy. Bits 3 and 4 are read to form this status bit.
- Bit 2 Interrupt Pending. A logic 1 indicates a condition for an interrupt exists.
- Bit 3 Read Buffer Ready. A logic 1 indicates the receive buffer has data present and is ready for processing.
- Bit 4 Write Buffer Ready. A logic 1 indicates the write buffer is ready to receive more data.
- Bit 5 Transfer Error. A logic 1 indicates a transfer error has occurred between the IOP and the HSI PCA.
- Bit 6 Time Out. A logic 1 indicates the time-out generator has timed out after approximately 15 msec because of a lack of data transfer.
- Bit 7 Service Request Valid (SRVAL). A logic 1 indicates that a Data Set Ready (DSR) input is asserted (positive) and that the Receive Data signal from the selected channel is in a high (space) state with receive enabled.
- Bit 8, Channel Service. Bits 9 and 10 indicate which channel 9, and (0-3) is requiring service. Bit 8 determines if the 10 interrupt is from a DSR or Data-In condition (DSR = 0).
- Bit 11 Sense. A logic 1 indicates one of the four channels is in service.
- Bit 12 CRC Error. A logic 1 indicates a CRC check error.
- Bit 13 Over-Run Error. A logic 1 indicates another word has been received before the first word was serviced.
- Bit 14 Tag Bit Detected. A logic 1 indicates a detected tag bit.
- Bit 15 Compare Detected. A logic 1 indicates that either a six-bit address compare of a tag or a broadcast bit has been detected.

--------------	------------------	---------------------------------------	------------------------	----------------	-------	-------	---------------------	--------------	--------------------------------	----------------------	---------------	---------------------------	----------------------

NOTES:

1. The 16-bit control word is transferred to the interface PCA by a CIO instruction. The control word is stored on the interface PCA until bits are cleared as follows:
 - a. Control word bits 0, 1, 2, 3, 4, and 5 always become clear immediately after performing their function.
 - b. The entire control word is cleared to zero when either of the following takes place:
 - 1) An I/O reset occurs.
 - 2) Another control word which has 1 in position 0 is sent to the interface PCA by a CIO instruction.
 - c. A particular bit of the control word is cleared when another control word, with 0 in that bit position, is sent to the interface PCA by a CIO instruction.

2. Selective Interrupt Clear functions as follows:

CONTROL WORD	INTERRUPT STATUS	INTERRUPT CONDITION
BITS	BIT CLEARED	CLEARED
2	3	4
0	0	0
0	0	1
	None	None
	Bits 14 and 15	Clear transfer error Interrupt and timeout interrupt.
0	1	0
0	1	1
	Bit 13	Clear programmed interrupt.
0	1	1
1	0	0
1	0	1
	Bit 12	Clear input buffer full interrupt.
1	0	0
1	0	1
	Bit 11	Clear data transfer interrupt.
1	1	0
1	1	1
	Bit 8	Clear ready-for-command interrupt.
	Bit 9	Clear ready interrupt.
	Bit 10	Clear not-ready interrupt.

- Also terminates the 5-second I/O timeout cycle without an interrupt, if issued during the 5-second cycle.

CLEAR BUFFER FULL
STACKER CONTROL MODE
SELECT STACKER TWO
SECONDARY HOPPER SELECT
INHIBIT INPUT FEED

NOTE:

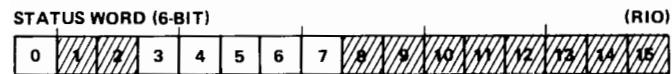

The 5-bit control word is transferred to the interface PCA by a WIO instruction.
The control word is stored on the interface PCA until one of the following occurs:

- a. Another WIO instruction is executed. (However, bit 1 is not affected.)
- b. A CIO instruction transfers a 16-bit control word to the interface PCA in which bit 0 (Master Clear) is 1. (Bit 1 is not affected.)
- c. An I/O reset occurs. (Bit 1 is not affected.)

Notes: An asterisk indicates signal origin is in card reader punch. Otherwise, signal origin is in the interface PCA.

In the PCA PIN columns, a comma indicates connection (in the plug) to the pin listed on the line beneath.

Each signal in this table has a signal-return wire. The return wire is connected to the pin matching that listed for the signal. Matching pins are on opposite sides of the PCA. For instance, the return wire for signal SST connects to pin J14-8 in the card reader punch. The other end of the same return wire connects to J3-2 on the interface PCA. On the card reader punch the return wires connect to **numbered** pins. On the interface PCA the return wires connect to **even-numbered** pins.

MAGNETIC TAPE DRIVE MASTER UNIT (7970E) CABLE CONNECTIONS

NOTES: 1 IF THE HP 7970E MASTER TAPE UNIT SHOWN IS UNIT 0, THIS WILL BE INTERFACE CABLE PART NO. 30215 60003. OTHERWISE IT WILL BE AN HP 13194A MULTIUNIT CABLE COMING FROM HP 7970B OR ANOTHER HP 7970E MASTER TAPE UNIT.

2 IF THE FOLLOWING UNIT IS ANOTHER HP 7970E MASTER TAPE UNIT, THIS CABLE WILL BE AN HP 13194A MULTIUNIT CABLE WITH READ CONNECTOR INSTALLED AS SHOWN. IF FOLLOWING UNIT IS AN HP 7970E SLAVE TAPE UNIT, THIS MUST BE AN HP 13194A 001 MULTIUNIT CABLE WITH READ CONNECTOR INSTALLED IN SLAVE READ POSITION AS DESIGNATED IN DRAWING.

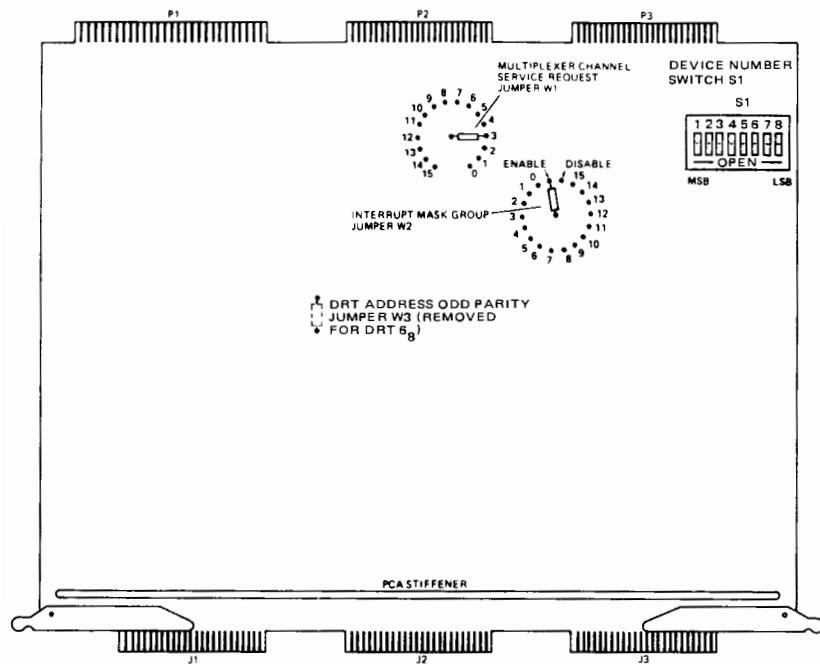

MAGNETIC TAPE DRIVE SLAVE UNIT (7970E) CABLE CONNECTIONS

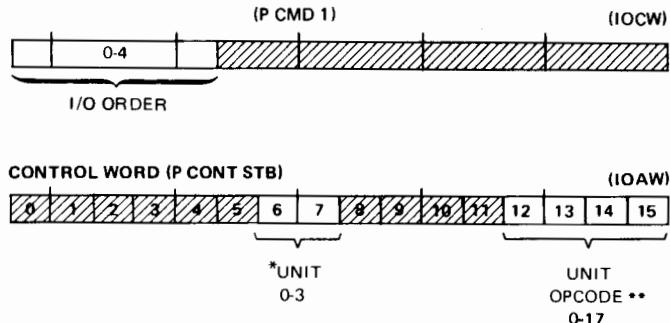

NOTE IF ADDITIONAL HP 7970E SLAVE TAPE UNIT IS USED, HP 13194A 001 MULTIMODULE CABLE MUST BE USED TO CONNECT TO THE FOLLOWING UNIT.

2. THERE IS NO PARITY JUMPER LOCATED ON THIS PCA.

3. ON PCAs WITH DATE CODE 2002 OR NEWER, UNITS 31, 32, 41, 42, 51, 52, 61
AND 62 (SHOWN BOXED-IN) ARE ON SOCKETS, AS A LIGHTNING-PROTECTION
MEASURE. PAGE 8-52A SHOWS WHICH OF THESE UNITS MAY BE CAUSING A
FAILURE OF A PERIPHERAL CONNECTED TO THE MUX PANEL.

147006-98

Peripherals

TDI PCA Chips Related to MUX Panel Ports

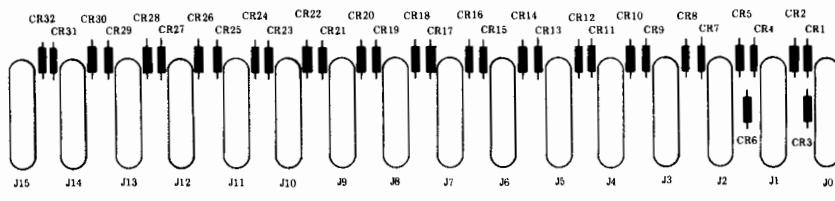

If a peripheral connected to one of the ports on the MUX Panel fails, you may begin troubleshooting by matching the part with the TDI PCA Unit shown below, and replacing the Unit with a new chip. (The Units are on sockets, as shown on page 8-52.)

FAILED PORT ON MUX PANEL	TDI PCA CHIP PART NUMBER							
	1820-0509				1820-0990			
	U31	U32	U41	U42	U51	U52	U61	U 62

PLOTTER INTERFACE DIAGNOSTIC TEST HOOD WIRING DIAGRAM

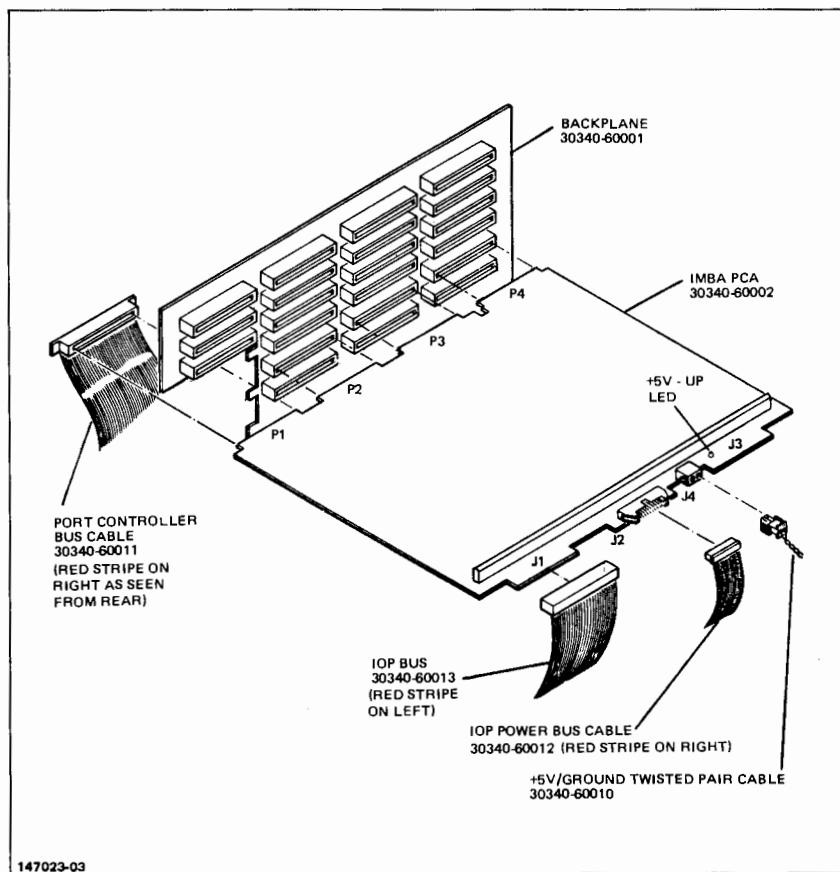

PLOTTER INTERFACE DIAGNOSTIC TEST HOOD JUMPER FUNCTIONS

JUMPER CONNECTION		FUNCTION
FROM	TO	
A4 (J1-7)	A5 (J1-9)	Connects the clear-side of the Limit Switch Diagnostic flip-flop (U141B) to the clock input of the Limit Switch Interrupt flip-flop (U38B). Permits the diagnostics to check the limit switch interrupt function.
B5 (J1-10)	A6 (J1-11)	Connects the +5V supply to the VIN (J1-11) pin on the plotter interface PCA to provide +5V plotter input signals rather than the normal +15V signals.
B8 (J1-16)	A7 (J1-13)	Grounds the input to inverter (U26D) to force the Good Data Clock signal active. This enables all plot command data transfer circuitry decoders.
A7 (J1-13)	A12 (J1-23)	Grounds one input to the diagnostic multiplexer (U154) to cause bit 3 of the diagnostic status word to be a "0" when series 600/700 plot command data is selected, ie, when the select line is inactive.
A12 (J1-23)	A25 (J1-49)	Grounds the enable line of the diagnostic multiplexer (U154 and U164). This allows either series 500 or series 600/700 plot command data to be provided as part of the diagnostic status word (bits 3 through 8).
A9 (J1-17)	A15 (J1-29)	Simulates the clock jumper W1 to ensure that the full step clock output will be used during all diagnostic testing.
A10 (J1-19)	A17 (J1-33)	Connects data out bits 3 or 11 (series 600/700) to the input of the diagnostic multiplexer (U154) to provide bit 4 of the diagnostic status word when the select line is inactive.
A11 (J1-21)	B23 (J1-46)	Connects the pen down plot command (series 500) to the input of the diagnostic multiplexer (U154) to provide bit 4 of the diagnostic status word when the select line is active.
A13 (J1-25)	A23 (J1-45)	Connects the pen up plot command (series 500) to the input of the diagnostic multiplexer (U154) to provide bit 3 of the diagnostic status word when the select line is active.
A14 (J1-27)	A22 (J1-43)	Connects the +Y plot command (series 500) to the input of the diagnostic multiplexer (U164) to provide bit 7 of the diagnostic status word when the select line is active.
A16 (J1-31)	B9 (J1-18)	Connects data out bits 6 or 14 (series 600/700) to the input of the diagnostic multiplexer (U164) to provide bit 7 of the diagnostic status word when the select line is inactive.
A18 (J1-35)	B15 (J1-30)	Connects data out bits 5 or 13 (series 600/700) to the input of the diagnostic multiplexer (U164) to provide bit 6 of the diagnostic status word when the select line is inactive.
A21 (J1-41)	B14 (J1-28)	Connects the +X plot command (series 500) to the input of the diagnostic multiplexer (U164) to provide bit 6 of the diagnostic status word when the select line is active.
B10 (J1-20)	B21 (J1-42)	Connects the -Y plot command (series 500) to the input of the diagnostic multiplexer (U164) to provide bit 8 of the diagnostic status word when the select line is active.
B11 (J1-22)	B17 (J1-34)	Connects data out bits 7 or 15 (series 600/700) to the input of the diagnostic multiplexer (U164) to provide bit 8 of the diagnostic status word when the select line is inactive.
B12 (J1-24)	B22 (J1-44)	Connects the -X plot command (series 500) to the input of the diagnostic multiplexer (U164) to provide bit 5 of the diagnostic status word when the select line is active.
B13 (J1-26)	B18 (J1-36)	Connects data out bits 4 or 12 (series 600/700) to the input of the diagnostic multiplexer (U164) to provide bit 5 of the diagnostic status word when the select line is inactive.

NOTES

HP 30341A SERIES III HP-IB INTERFACE MODULE
IMBA PCA CABLE CONNECTIONS

Peripherals

**HP 30341A SERIES III HP-IB INTERFACE MODULE
SELF-TEST**

- a. Depress BIC PCA's CPU TEST switch.
- b. The "*" LED will light and remain lighted as long as the test runs. When the test finishes successfully, or an error is detected, the "*" LED will extinguish, and the "A" through "I" LED's will indicate results, as follows.
 - (1) If NO peripherals are attached to the Interface Module and the test is successful, the code %740 will appear on the "A" through "I" LED's. (The %740 will flash a few times, then stay lighted.) If any other pattern appears, an error has been detected; use the following table as a troubleshooting guide. For example, if the "B," "C," and "F" LED's are lighted, error code %310 is indicated. The table shows that error code %310 means Processor PCA ROM Unit U141 is suspect.
 - (2) If a peripheral is attached, analyzing the LED display depends on whether the peripheral is a valid cold load device. If the peripheral IS a valid cold load device and the test is successful, all the LED's will go off. If the peripheral is NOT a valid cold load device and the test is successful, the code %750 will appear on the LED's. (It will flash a few times, then stay lighted.)

DIRECT I/O COMMAND DEFINITIONS

I/O Command	IOCMD Decode	IMBA PCA Operation
CIO %100000	001	Causes a master clear of the IMBA PCA
TIO	101	<p>Causes the IMBA PCA to return a 3-bit status word (IOD0-IOD2) to the computer system. The status word format is listed below. (Bits IOD3-IOD15 are undefined.)</p> <p>IOD0 - SIO OK Bit. When set to 1, indicates that any previous SIO to the IMBA PCA is not active.</p> <p>IOD1 - RIO OK Bit. Always set to 1.</p> <p>IOD2 - +5V OK Bit. When 1, indicates that +5 V from the power supply is available on the IMB.</p>
SIO	010	Causes the IMBA PCA to generate the Channel Service Request (CSRQ1) signal on the IMB. The operator running the SIO microdiagnostic should note that the status returned by the 30341A will be %177.
RIL	100	Causes the IMBA PCA interrupt logic to be reset. This command can only be issued as part of the IXIT instruction.

### 2635A/2635K PRINTER TERMINAL ON-LINE VERIFICATION PROGRAM - D474

Set the HP 2635A switches as follows:

AC POWER to ON  
DUPLEX to FULL  
PARITY to NONE  
If using a modem, set BAUD RATE to required position.  
If terminal is hardwired, set BAUD RATE to any position.  
DISPLAY FUNCTIONS to unlatched  
REMOTE to latched  
CAPS LOCK to unlatched  
AUTO LF to unlatched

:HELLO FIELD.SUPPORT,HP32230;TERM=15 or TERM=16

#### NOTE

When logging on, you must select either TERM type 15 or 16. Terminal type 15 allows the HP 2635A to be used in an 8-bit environment. Terminal type 16 allows the HP 2635A to be used as a 7-bit terminal with parity.

:RUN PD474A

| 4    | Vertical Format Channels            |

2645K TERMINAL  
ON-LINE VERIFICATION PROGRAM - D476

Set the HP 2645K switches as follows:

AC POWER to ON  
CAPS LOCK to unlatched  
DUPLEX to HALF and disable echo function with ESC;C  
(This is not a mandatory switch setting. If DUPLEX is set to FULL, you will have to manually invoke the Roman character set before responding after a Katakana display.)

MINI-OPERATING INSTRUCTIONS

1. Verify proper online operation.
2. Enter the following system commands:

```
:HELLO FIELD.SUPPORT,HP32340A
:RUN PD467A.HP32340A.SUPPORT
```

3. Perform procedures requested by the verifier.

Note

Use the printer self-test function (on top panel keyboard) to run the complete set of printer diagnostics.

4. To run printer self tests, enter 1 ENT on the printer keyboard.

Diagnostic

HP 7976A MAGNETIC TAPE UNIT  
DIAGNOSTIC LOADER  
MINI-OPERATING INSTRUCTIONS

Log and enter the following:

:HELLO FIELD.SUPPORT,HP32340  
:RUN PD470A or  
:RUN PD470A, MANUAL

If the Loader is run in Auto mode, minimal user interaction is necessary. In Manual mode the Loader prompts the user for the desired operation:

Routing (RTssrree). Selftest, Loopback, Auto, Exit?

Where:

ss is the section designator in OCTAL  
rr is the routine designator in OCTAL  
ee is the routine extension field in OCTAL

Refer to HP 7976A Subsystem Diagnostic Manual (p/n 07976-90906) for test routine descriptions, error codes and messages.

7905A/7920A/7925A DISC DRIVE  
STAND-ALONE DIAGNOSTIC - SLEUTH07

## NOTE

If you are not familiar with SLEUTH (D411) and SLEUTH07, refer to the Disc Drive Verifier Stand-Alone SLEUTH Program SLEUTH07 Manual, part no. 32230-90002 for additional information.

If you intend to use the customer's disc packs for running SLEUTH07, check that a SYS DUMP with a 0 dump date was performed. Ensure that all disc surfaces have been backed up before running SLEUTH07.

Obtain the disc controller DRT number from the System Support Log or from the list of I/O devices that was printed at SYS DUMP.

Ensure that the SLEUTH utility (D411) is present on a cold loadable I/O stand-alone magnetic tape and shutdown the MPE Operating System.

Set the disc drive READ ONLY switch to OFF and, if formatting is planned, set the FORMAT switch to ON. Set the System Control Panel PF/ARS switch to ENBL.

Mount the SLEUTH utility I/O stand-alone tape on a magnetic tape drive, select unit 0, place the tape at load point, and place the unit on-line.

Set the System Control Panel Switch Register to %003006 and simultaneously press the ENABLE and LOAD switches.

Place the location that SLEUTH occupies on the I/O stand-alone tape into the Switch Register.

Press the RUN switch and, on the console, press RETURN to start SLEUTH execution.

Remove the I/O stand-alone tape and mount the tape that contains SLEUTH07 on the magnetic tape drive. Place the tape at load point and the unit on-line.

```
>10 BA E
>900 RUN
7905/7920/7925 VERIFIER, ENTER DRT #

END VERIFY

BEGIN MAIN

END HEAD TEST

END TRACK SWITCH TEST

END WRITE/READ TEST

>900 (Halt the computer to end SLEUTH execution.)

You may terminate SLEUTH07 execution with a control-A or by setting Switch Register switches 0 and 13. Following termination, you can: (1) type RUN to repeat tests, (2) type any other SLEUTH command, or (3) press the computer HALT switch.

Refer to Section X of this manual for SLEUTH07 program listing.

MULTIPLEXER CHANNEL  
STAND-ALONE DIAGNOSTIC - D422

1. Cold Load Diagnostic File from Non-CPU Cold Load Tape.
2. Respond to Speed-Sense by typing "CR" on the Console.
3. Respond to the dialogue on the Console.

## Diagnostics

### TERMINAL DATA INTERFACE (TDI) STAND-ALONE DIAGNOSTIC - D427

1. Remove and label all connectors from Terminal Controller/Multiplexer Connector Panel.

#### NOTE

In order to make a complete test of the interface (all 16 channels), 8 successive channel selections should be made.

2. Connect test cable (30062-60002) to the two channels to be tested.
3. Cold load Diagnostic D427A from stand-alone diagnostic tape. Program will halt with a HALT 6.
4. Select switch register options. (See below.)

#### NOTE

To run diagnostic with preset configuration, set switch register bit 0 OFF.

5. Press RUN. The program halts for channel selection with a HALT 7.
6. Select channel pair to be tested (the two channels connected in step 2).
  - a. Enter the lower numbered channel to be tested (octal value) in the first byte (right justified) of the switch register.
  - b. Enter the upper numbered channel to be tested (octal value) in the second byte (right justified) of the switch register.
7. Press RUN. HALT 6 occurs. Channel numbers have now been entered.
8. Press RUN. Test Sections 1 through 7 will be executed.
  - a. If a HALT %16 occurs, the test executed without errors. Repeat steps 2 and 6 through 8 for the next channel pair to be tested.
  - b. If HALT %12 is displayed, an error has been encountered.

## TERMINAL DATA INTERFACE DIAGNOSTIC (Continued)

## SWITCH REGISTER OPTIONS:

| BIT  | FUNCTION                                                     |

## Diagnostics

### HARDWIRED SERIAL INTERFACE (HSI) STAND-ALONE DIAGNOSTIC - D432

1. For the channel to be tested, set the corresponding TEST/NORMAL switch on the HSI Cable Assembly Panel to the TEST position.
2. Cold load the D432 diagnostic program from a stand-alone diagnostic tape. Press RETURN. The program halts (HALT %6) to allow for entering options.
3. To run the diagnostic program when it has been preconfigured (using SDUPII), ensure bit 0 of the System Control Panel switch register is OFF (0). Press RUN.
4. The program executes each test section (tests 1 through 9) and prints an End-of-Section message after the test completes successfully. If a hardware error occurs, an error message is printed and execution terminates.
5. After all nine test sections execute, the program prints an End-of-Diagnostic message and halts (HALT %15).

#### NOTE

The preset baud rate is 2.5 Mbits/sec and the preset channel is 0. For a complete test, these values must be changed. Channel and baud selection is part of the preconfiguration procedure.

#### SWITCH REGISTER OPTIONS:

| BIT | FUNCTION                          |
|-----|-----------------------------------|
| --- | -----                             |
| 0   | Update Switch Register Options    |
| 1   | Change Section Select Options     |
| 2-6 | Not Used                          |
| 7   | Send Messages to Line Printer     |
| 8   | Not Used                          |
| 9   | Suppress Non-Error Messages       |
| 10  | Suppress Error Messages           |
| 11  | Loop on Step                      |
| 12  | Halt on Error                     |
| 13  | Halt After Step                   |
| 14  | Halt After Section                |
| 15  | Halt After Complete Program Cycle |

| 15  | Execute Section 15 (Manu - Write/Read)                 |

## Diagnostics

### SYNCHRONOUS SINGLE-LINE CONTROLLER (SSLC) STAND-ALONE DIAGNOSTIC - D434

1. For running the first six test sections in synchronous mode, attach interface cable 30055-60011 to the SSLC and terminate the free end with the 30055-60009 test connector. For running the first six test sections in asynchronous (hardwired) mode, attach interface cable 30055-60010 to the SSLC and terminate the free end with the 30055-60009 test connector.
2. Cold Load diagnostic D434 from the stand-alone diagnostic tape. Type "CR" on console.
3. Program halts (HALT 6). Set bit 0 of the operating panel switch register OFF. Press RUN.

In case of hardware error, error messages will be printed.

#### PRESET CONFIGURATION

\* The segment number can be seen in the Computer's Status  
Register bits 8 through 15.

\*\* At HALTs 14, 15, and 16 these Registers contain data:

RB - Interface/Interrupt Status Word (see the Maintenance  
Manual for the interface being tested).  
RC - The data word read, where applicable.  
RD - The data word written, where applicable.

TERMINAL CONTROLLER INTERFACE (TCI)  
STAND-ALONE DIAGNOSTIC - D438

1. Remove all connectors from HP 30062A Terminal Controller/Multiplexer connector panel, 30062-60002. Connection will be made between channel pairs by test cable 30062-60003 during the test.
2. Cold load diagnostic D438 from stand-alone diagnostic tape. Program will halt (HALT 6). Press RUN with switch register bit 0 OFF, to run diagnostic with preset configuration. In the preset configuration, the channel selection is manual.
3. Channel Selection -- The program halts for channel selection with HALT 7 before the execution of the first test and with HALT %16 after the completion of the test for any channel pair. The test will execute between the two channels whose channel number is entered through the switch register. One channel number should be entered to the first byte of the switch register and the other in the second byte. Both numbers are octal (0-17) and right justified in their respective byte position. The connection should be made between the two specified channels by the test cable.

In order to make a complete test of the interface (all 16 channels), 8 successive channel selections should be made. The following convenient order is recommended by: Channel 0 channel 1 first, channel 2 channel 3 second and so on until channel 14, channel 15.

4. After each channel selection, the program will halt again with HALT 6 for switch register option selection. Press RUN (with switch register bit 0 kept OFF).
5. The program will halt after each channel pair test with HALT %16, if the interface is error free. Errors will be indicated by error halts (HALT %12). Error information will be displayed on the "TOS."

## Diagnostics

PLOTTER INTERFACE  
STAND-ALONE DIAGNOSTIC - D439

1. Cold Load Diagnostic File from Non-CPU Cold Load Tape.
2. On console device, press "Carriage Return". Enter switch register options. Program halts (HALT 6).
3. To run diagnostic with preset configuration, press RUN with operating panel switch register bit 0 OFF.
4. The diagnostic will start to execute. Messages on the console device will instruct the operator when intervention is necessary. The preconfigured section selection is only for test section 1. In this test section, the only operator intervention is the installation of the test connector (30226-60003). The program prints a corresponding message on the console and halts (HALT 7). Install test connector and press RUN.
5. The program either runs to completion and halts with HALT %15 indicating that the interface is error-free or in case of error it will print error message(s).

HP 32234A COBOL II FIRMWARE  
STAND-ALONE DIAGNOSTIC - D441A AND D442A

1. Cold load diagnostic file from non-CPU cold load tape.
2. Enter number corresponding to the diagnostic's position on the cold load tape (%26 or %27) into the Switch Register.
3. Press CPU front panel RUN switch and assert "CR" on system console.

NOTE

Both diagnostics will loop indefinitely unless Switch Register bit 15 is set.

SWITCH REGISTER OPTIONS:

| BIT#  | FUNCTION                                                                                                            |
|-------|---------------------------------------------------------------------------------------------------------------------|
| ---   | -----                                                                                                               |
| 0     | When set, causes SWREG1 to be loaded with the configuration set into the Switch Register.                           |
| 1     | When set, causes program execution to stop for re-configuration.                                                    |
| 2-6   | Unused                                                                                                              |
| 7     | When set, directs messages to line printer.                                                                         |
| 8     | Unused                                                                                                              |
| 9     | When set, suppresses non-error messages.                                                                            |
| 10    | When set, suppresses error messages.                                                                                |
| 11    | Unused                                                                                                              |
| 12    | When set, causes program execution to stop with HALT %12 in the CIR if a recoverable error is detected.             |
| 13-14 | Unused                                                                                                              |
| 15    | When set, causes program execution to stop with HALT %15 in the CIR after one complete pass through the diagnostic. |

## SLEUTH01 - 2893A CARD READER

THIS PROGRAM TESTS THE BASIC FUNCTIONS OF THE 2893A CARD READER.  
THE TEST DECK MAY BE GENERATED USING THE READER/PUNCH SLEUTH GENERATED TEST. THE TEST DECK CONSISTS OF THE FOLLOWING CARDS.

```
1 - DOUBLE CARD
1 - INVALID HOLLERITH CARD
1 - COLUMN BINARY CARD
1 - PACKED BINARY CARD
56 - ASCII CARDS (BASIC CHARACTER SET)
1 - BLANK CARD
```

THE STEPS AND FUNCTIONS PERFORMED ARE AS FOLLOWS:

| STEPS   | FUNCTION                                                            |
|---------|---------------------------------------------------------------------|
| 40/410  | CHECKS CORRECT OPERATION OF MANUALLY OPERATED SWITCHES AND BUTTONS. |
| 420     | TESTS INTERRUPT CAPABILITY WITH SIN.                                |
| 430/490 | CHECKS THROAT GAP ALIGNMENT.                                        |
| 530/570 | TESTS INVALID HOLLERITH READ.                                       |
| 580/590 | CHECKS COLUMN BINARY READ.                                          |
| 600/610 | CHECKS PACKED BINARY READ.                                          |
| 620/750 | TESTS DATA PATTERN AND CHARACTER SET.                               |
| 760     | PRINTS END OF PASS MESSAGE.                                         |

## SLEUTH04 - 7905A DISC DRIVE

THIS PROGRAM EXERCISES A 7905 DISK DRIVE. IT IS PRIMARYLY DESIGNED TO CHECK CORRECT FUNCTIONING OF THE SERVO SYSTEM. SINCE ONLY SEEKS AND READS ARE ISSUED, ANY DATA ON THE DISK IS LEFT STILL INTACT. IF A TEST FAILS, THE STEPS INVOLVED IN GENERATING THAT TEST MAY BE TYPED IN AND LOOPED ON FOR TROUBLESHOOTING PURPOSES.

SLEUTH07 - 7905A/7920A/7925A DISC DRIVES

NOTE

Additional information for running SLEUTH07  
is contained in Section IX of this manual.

THIS PROGRAM TESTS WHETHER THE DISC DRIVE RESPONDS TO UNIT NUMBER  
TYPED ON THE CONSOLE, PERMITS DISC PACK FORMATTING AND VERIFICA-  
TION, AND TESTS WHETHER THE DISC HEADS CAN READ AND WRITE BOTH  
WITH AND WITHOUT TRACK SWITCHING.

## Error Messages

### COLD LOAD ERROR MESSAGES

While cold loading the system, one of the following cold load error messages may appear. MPE will output a special message on the operator console and halt. There are hardware halts that also occur while cold loading the system. In this case, refer to the Cold Load Hardware Halts List.

| MESSAGE                         | MEANING                                                                                                                     | RECOVERY PROCEDURE                                                                                                                                                                             |
|---------------------------------|-----------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| BAD DISC ADDRESS                | An address greater than the available number of sectors on the disc driver. This indicates an error internal to the system. | Attempt to COLDSTART from another tape. If this fails, attempt a RELOAD; if this fails, use the disc diagnostic to re-format all discs and try to RELOAD again.                                |
| BAD FILE ADDRESS                | You attempted to write outside the range of one of the system files.                                                        | You should attempt a RELOAD. If this is unsuccessful, use the disc diagnostic to re-format all discs and try to RELOAD again.                                                                  |
| COLD LOAD TAPE READ ERROR       | A tape-read error was detected during the cold load operation.                                                              | You should clean the tape heads and retry. If this is unsuccessful, try a different tape (any tape produced by :SYSDUMP with the current version of the operating system being cold loadable). |
| DIRECTORY ERROR<br>A=<A>, B=<B> | An error occurred while accessing the directory.<br>Refer to table of Directory Errors.                                     | .                                                                                                                                                                                              |

## COLD LOAD ERROR MESSAGES (Continued)

| MESSAGE                        | MEANING                                                                                                                                                     | RECOVERY PROCEDURE                                                                                                                                                                                                                                                                                                     |
|--------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DISC SPACE ERROR               | A conflict exists between the disc free-space map and the space used as defined in the directory.                                                           | You should attempt a RELOAD. If RELOAD is unsuccessful, use the disc diagnostic to re-format all discs, then attempt to RELOAD again.                                                                                                                                                                                  |
| DISC DRIVER DOES NOT EXIST     | You attempted a transfer to a disc with a type or subtype unknown to the system, which indicates a disc error has occurred on the specified logical device. | You should attempt to cold load again. If any non-standard drivers (non-HP I/O Drivers) are in the configuration, they should be deleted. If this fails, attempt to cold load from a different tape. If this fails, try to RELOAD. If this fails, run the disc diagnostic to format all discs and try to RELOAD again. |
| DISC READ WRITE ERR ON SEEK    | A disc error has occurred on the specified ldn.<br>LDEV#<LDEV>STATUS=%<STATUS>ADDR=%<ADDR>WORDS=<WORDS>                                                     | You should cold load again as you will be prompted to take action on the bad track.                                                                                                                                                                                                                                    |
| EOF                            | An attempt has been made to read past the end of one of the system files.                                                                                   | You should attempt a RELOAD. If this fails, use a different system tape and try again.                                                                                                                                                                                                                                 |
| FILE name .PUB.SYS NOT ON DISC | This specified file was needed but was not found in the directory.                                                                                          | Obtain another tape containing the system and UPDATE. If no current system tape is available, attempt UPDATE to an obsolete version of the system as a temporary measure.                                                                                                                                              |

## Error Messages

### COLD LOAD ERROR MESSAGES (Continued)

| MESSAGE                         | MEANING                                                                                                                                              | RECOVERY PROCEDURE                                                                                                                                                                                                                                          |
|---------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| IMPROPER TAPE FORMAT            | The information on the tape you used for RELOAD does not agree with the format of tapes produced by the :STORE and :SYS DUMP commands.               | You should locate the correct tape set and start the RELOAD operation again. If you are sure the tape set you are using was produced by :SYS DUMP, go back to a previous generation of back up tapes and try again. Use a different tape drive if possible. |
| IOP ERROR                       | An impossible status indication was returned by the tape controller, indicating a failure in the controller or the input/output processor.           | This message is always caused by a hardware problem and is not usually recoverable. (It can indicate IOP, controller, or memory errors.) Retry the cold load operation.                                                                                     |
| MOUNT CORRECT VOLUMES OR RELOAD | On a COOLSTART, COLDSTART or UPDATE, not all of the previously-defined volumes were found.                                                           | You should either mount the correct volumes and start the COOLSTART, COLDSTART or UPDATE over, or you should RELOAD.                                                                                                                                        |
| OUT OF BOOTSTRAP DISC SPACE     | The 30 sectors of the system disc allocated to the bootstrap program and certain tables have been exceeded; this is an error internal to the system. | You should attempt to RELOAD the system. If this fails, attempt to RELOAD from a different tape set.                                                                                                                                                        |
| OUT OF CST ENTRIES              | The Initiator has run out of code segment table entries for the system.                                                                              | Re-build the system tape (through the :SYS DUMP command), increasing the number of entries in this table.                                                                                                                                                   |

## COLD LOAD ERROR MESSAGES (Continued)

| MESSAGE            | MEANING                                                                                                                                                                                                               | RECOVERY PROCEDURE                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| OUT OF DST ENTRIES | The Initiator has run out of data segment table entries for the system.                                                                                                                                               | Re-build the system tape (through the :SYS DUMP command), increasing the number of entries in this table.                                                                                                                                                                                                                                                                                                                                                           |
| OUT OF MEMORY      | The amount of space needed to build the main-memory resident portion of the system, and contain one segment of the Initiator program and its associated tables, has exceeded the available memory size (usually 64K). | The Initiator program requires a minimum of 64K words (128K bytes) to run. If the system has been configured incorrectly below this value during a cold load, correct the error and try again. If the tables configured have memory sizes greater than 64K words, then all resident tables must reside in bank 0. If the system tape you are using for cold load was configured in error, it can be corrected by changing the memory size via the Initiator dialog. |
| OUT OF PCB ENTRIES | The Initiator has run out of process control block table entries for the system.                                                                                                                                      | Re-build the system tape (through the :SYS DUMP command), increasing the number of entries in this table.                                                                                                                                                                                                                                                                                                                                                           |

| MESSAGE                                                   | MEANING                                                                                                                                                                                                               | RECOVERY PROCEDURE                                                                                                                                                                              |
|-----------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| OUT OF SYSTEM DISC SPACE                                  | The virtual memory, directory, and system file disc space required exceeds that available on the system disc. Usually, the system disc is cluttered with user files and an attempt is made to update to a new system. | The System Manager/ Supervisor must create a new system tape to correct the problem. It may be necessary to use the previous system tape to bring up MPE, then delete the files on system disc. |
| OUT OF WSTAB ENTRIES                                      | The Initiator has run out of working set table entries for the system.                                                                                                                                                | Re-build the system tape (through the :SYS DUMP command), increasing the maximum number of currently running programs allowed on the system.                                                    |
| PREVIOUS RELOAD ABORTED; MUST RELOAD                      | The last cold load was a RELOAD that was aborted.                                                                                                                                                                     | You must cold load again with a RELOAD.                                                                                                                                                         |
| PREVIOUS TAPE COLD LOAD ABORTED; MUST COLD LOAD FROM TAPE | The last cold load was a COLDSTART or an aborted UPDATE.                                                                                                                                                              | You must cold load again with COLDSTART UPDATE or RELOAD.                                                                                                                                       |
| READING BLANK TAPE                                        | There is either a defective tape or a defective tape controller. (Reported by the magnetic tape controller.)                                                                                                          | You should try to cold load using a known good system tape.                                                                                                                                     |
| SYSTEM TABLE ON DEFECTIVE TRACKS - CANNOT WARMSTART       | At least one of the tables (DST Descriptor table, JMAT, IDD or ODD) which must be recovered for a WARMSTART is located on defective tracks.                                                                           | You may attempt either a COOLSTART, COLDSTART, or RELOAD. You will be requested to take some action on the defective track.                                                                     |

| MESSAGE                             | MEANING                                                                                                      | RECOVERY PROCEDURE                                                                                                                                                                                                                                                                                                            |
|-------------------------------------|--------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TAPE I/O CMD REJECTED               | There is a defective tape controller. (Reported by the magnetic tape controller.)                            | If possible, you should try another tape drive.                                                                                                                                                                                                                                                                               |
| TAPE PARITY ERROR                   | A parity error was detected while reading the magnetic tape.                                                 | You should clean the tape heads and try again. If the problem persists, try another system tape, or try another tape drive if possible.                                                                                                                                                                                       |
| TAPE TRANSFER ERROR                 | There is either a defective tape or a defective tape controller. (Reported by the magnetic tape controller.) | You should clean the tape heads and try again. If the problem persists, try another system tape, or try another tape drive if possible.                                                                                                                                                                                       |
| TAPE UNIT WENT NOT READY            | There is either a bad tape controller or you switched the tape off-line during an operation.                 | You should make sure the unit is selected and ready. If the HP 3000 Control Panel and Maintenance Panel are available, select the P register and display; set the SYSTEM SWITCH REGISTER to the P value plus 2 and load P register. Press the RUN/HALT switch. If the panels are not available, the error is not recoverable. |
| TIMING ERROR                        | Bad tape controller.                                                                                         | Checkout the tape controller.                                                                                                                                                                                                                                                                                                 |
| VOLUME TABLE DESTROYED, MUST RELOAD | Volume table on system disc is overwritten.                                                                  | RELOAD the system and format the disc consider problems power/gnd related.                                                                                                                                                                                                                                                    |

## Error Messages

### SADUTIL I/O ERROR MESSAGES

Error messages are issued by SADUTIL when an I/O operation fails or when an error occurs during SADUTIL operation.

Disc errors resulting from sectors outside the directory, absence of required account entries, bad tracks, or invalid label comparisons can be investigated with the EDIT function.

When an error occurs on magnetic tape, one of the following SADUTIL I/O Error Messages will be issued. The SAVE operation is terminated and SADUTIL prompts for the next function.

| MESSAGE             | MEANING                         | ACTION |
|---------------------|---------------------------------|--------|
| UNIT WENT OFF-LINE  | Magnetic tape unit is off-line. |        |
| NOT READY INTERRUPT |                                 |        |
| TRANSFER ERROR      |                                 |        |
| CMD REJECT          |                                 |        |
| TAPE RUN AWAY       |                                 |        |
| TIMING ERROR        |                                 |        |
| TAPE PARITY ERROR   | Magnetic tape parity error.     |        |

Following each of the messages, SADUTIL prints:

```
/ \
| WRITE |
TAPE < EOF > ERROR
| BACKSPACE |
\ /
```

## SADUTIL OPERATION ERROR MESSAGES

When an error occurs during operation of SADUTIL, one of the following SADUTIL Operation Error Messages will appear at the system console. SADUTIL continues after using the message and you are prompted for further input.

| MESSAGE                                                             | MEANING                                                                                                                                                                                                                                                                  | ACTION                                                                                                          |
|---------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------|
| *ACCOUNT NOT IN DIRECTORY                                           | In a PFIL function request, a referenced file belongs to an account not present in the System File Directory.                                                                                                                                                            | Re-enter the file reference with the correct account name.                                                      |
| DIRECTORY ERROR                                                     | During a COND operation, an error was found in the System File Directory.                                                                                                                                                                                                | Use the EDIT function of SADUTIL to analyze the problem or see your system manager.                             |
| DISC READ ERR ON SEEK LDEV # ldn STATUS=%statusval ADDR=%sectoraddr | SADUTIL was unable to complete the particular I/O operation to or from disc. ldn is the logical device number of the volume, statusval is the hardware status word of the device after operation, sectoraddr is the address of the disc sector where the error occurred. | If the error occurs on a removable disc, remove the disc and replace it with a new scratch disc; rerun SADUTIL. |
| *FILE NOT IN DIRECTORY*                                             | In a PFIL operation, a referenced file is not present in the System File Directory, although the account and group names were valid and present.                                                                                                                         | Re-enter the file reference with the correct file name.                                                         |

## Error Messages

## SADUTIL OPERATION ERROR MESSAGES (Continued)

| MESSAGE                      | MEANING                                                                                                                                                                                                       | ACTION                                                   |
|------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------|
| *FUNCTION NOT COMPLETED*     | The function in process encounters an irrecoverable error, such as disc I/O error, and terminates. The requested operation is not completed. (This message typically follows a message explaining the error.) |                                                          |
| *GROUP NOT IN DIRECTORY*     | In a PFIL request, a referenced file belongs to a group not present in the System File Directory, although the account name was valid and present.                                                            | Re-enter the file reference with the correct group name. |
| ILLEGAL DEVICE SPECIFICATION | An input/output device was specified for a function (such as EDIT, PFIL, SAVE, or STOP) that does not use a device specification.                                                                             | Re-enter the function keyword correctly.                 |
| *INVALID*                    | The response to a prompt was not recognizable.                                                                                                                                                                | At next prompt, re-enter response correctly.             |
| *INVALID COMMAND*            | An invalid (unrecognizable) EDIT command was encountered.                                                                                                                                                     | At next prompt, re-enter command correctly.              |
| INVALID DEVICE SPECIFICATION | The function keyword is correct but the input/output device specification is invalid, for instance a special character or an unrecognizable number.                                                           | At next prompt, re-enter device specification correctly. |

## LISTLOG2 ERROR MESSAGES

If an error occurs in the LISTLOG2 utility program, one of the following LISTLOG2 error messages will be printed on the standard list device. Fatal errors call the QUIT intrinsic (intrinsic 99) after the error message is printed, terminating the program.

| MESSAGE                                               | MEANING                                                                                                       | ACTION                                                                                          |

| The error number (xx) is the FCHECK error code and the log file number (xxxx) identifies the log file of the error. |                                                                                                                                                    |                                                                                                          |

## MEMLOGAN ERROR MESSAGES

If an operational error is encountered by MEMLOGP, the process will print an error message on the console and terminate. The message printed on the occurrence of such an error is:

ST/<TIME>/MEMORY LOGGING ERROR #<ERRNUM>. LOGGING STOPPED.

The ranges and value for <ERRNUM> are:

1-10 - Internal MEMLOGP errors.

1 - FLOCK error on MEMLOG file.

2 - FUNLOCK error on MEMLOG file.

3 - TIO error. Error logging hardware not ready.

4 - CIO error during copy operation from logging array.

5 - RIO error during scan of logging array.

6-10 - Reserved for future use.

20-500 - File system errors involving MEMLOG file.

File system errors are described in the MPE Reference Manual. Unlike the system logging facility, all file system errors encountered by MFMLGP are fatal to the process and will cause it to terminate.
