Introduction to PowerMac G4

This developer note describes the PowerMac G4 computer. The note provides information about the internal design of the computer, its input-output and expansion capabilities, and issues affecting compatibility.

This developer note is intended to help hardware and software developers design products that are compatible with the Macintosh products described here. If you are not already familiar with Macintosh computers or if you would simply like additional technical information, refer to [“Supplemental Reference Documents”](#) (page 51) for additional information.

Organization of This Document

The information is arranged in four chapters and two appendixes:

- [“Overview of PowerMac G4”](#) (page 11) gives a summary of the features of the PowerMac G4 computer, describes the physical appearance of the enclosure, and lists compatibility issues of interest to developers.
- [“Architecture”](#) (page 17) describes the internal organization of the computer. It includes a functional block diagram and descriptions of the main components on the logic board.
- [“Input and Output Devices”](#) (page 27) describes the built-in I/O devices and the external I/O ports.
- [“Expansion”](#) (page 47) describes the expansion slots on the logic board and provides specifications for the expansion modules.
- [“Supplemental Reference Documents”](#) (page 51) provides sources of additional information about the technologies used in the PowerMac G4 computer.
- [“Conventions and Abbreviations”](#) (page 57) lists standard units of measure and other abbreviations used in this developer note.

I N T R O D U C T I O N

Introduction to PowerMac G4

Overview of PowerMac G4

The desktop PowerMac G4 computer uses single and dual PowerPC G4 microprocessors and is intended for use in content creation, desktop publishing, multimedia, scientific and technical applications, and other activities that require high performance.

New Features

Here is a list of the features that are new to the PowerMac G4 computer.

- **Microprocessor clock speed** Three clock frequencies are available: single 1 GHz, dual 1.25 GHz, and dual 1.42 GHz. For more information, see [“PowerPC G4 Microprocessor”](#) (page 18).
- **Graphics card** Four graphics cards are available: NVidia GeForce4 MX with 64 MB RAM, ATI Radeon 9000 Pro with 64 MB RAM, NVidia GeForce4 Titanium with 128 MB RAM, and ATI Radeon 9700 Pro with 128 MB RAM. All cards have ADC and DVI connectors. For more information, see [“Graphics Cards”](#) (page 24).
- **Hard disks** An internal Ultra ATA /100 hard disk occupies one of four drive bays and functions as the default boot disk. Space is available in that bay for an auxiliary Ultra ATA /100 device. An internal Ultra ATA /66 device supports two more drives. Optional hard disk capacities are: 60 GB, 80 GB, 120 GB, and 180 GB. For more information, see [“Hard Disk Drives”](#) (page 33).
- **Optical disk drives** The write speeds for the CD-R/CD-RW are double the previous model. For more information, see [“Optical Drives”](#) (page 34).
- **AirPort Extreme Card** The optional 54 Mbps AirPort Extreme Card provides a wireless LAN connection. For more information, see [“Wireless LAN Module ”](#) (page 21).
- **Bluetooth** The optional Bluetooth module enables short-range wireless connections between desktop and laptop computers and a host of other peripheral devices. For more information, see [“Bluetooth Technology \(Optional\)”](#) (page 37).
- **FireWire ports** The computer has two FireWire 400 ports and one FireWire 800 port. For more information, see [“FireWire Controllers”](#) (page 22).

Hardware Features Summary

Here is a list of the hardware features of the PowerMac G4 computer. The major features are described more fully later in this note.

- **Microprocessors** Three clock frequencies are available: single 1 GHz, dual 1.25 GHz, and dual 1.42 GHz. For more information, see [“PowerPC G4 Microprocessor”](#) (page 18).
- **Memory caches** The PowerPC G4 microprocessors used in the PowerMac G4 computer have an internal 256 KB level 2 cache. The computer also has an external 1 or 2 MB level 3 cache. For more information, see [“Cache Memory”](#) (page 19).

- **Processor system bus** The bus has 64-bit wide data and 32-bit wide address, a 133 or 167 MHz clock, and supports MaxBus protocol. For more information, see [“Processor Bus”](#) (page 19).
- **DDR SDRAM** Four DIMM slots for 184 pin DIMMs (dual inline memory modules) using DDR (double data rate) SDRAM devices. A minimum of 256 MB of RAM is installed in one of the slots, and the system is capable of a maximum of 2 GB. For more information, see [“Main Memory Bus”](#) (page 20).
- **ROM** The ROM-in-RAM implementation with 1 MB of boot ROM. For information about the ROM, see [“Boot ROM”](#) (page 21). For information about the ROM-in-RAM implementation, see the references listed in [“ROM-in-RAM Architecture”](#) (page 52).
- **Graphics card** Four graphics cards are available: NVidia GeForce4 MX with 64 MB RAM, ATI Radeon 9000 Pro with 64 MB RAM, NVidia GeForce4 Titanium with 128 MB RAM, and ATI Radeon 9700 Pro with 128 MB RAM. All cards have ADC and DVI connectors. For more information, see [“Graphics Cards”](#) (page 24).
- **Sound** On front panel: a built-in speaker and 3.5 mm headphone jack. On rear panel: 3.5 mm line-out jack, 3.5 mm line-in jack, and 2.5 mm Apple Pro Speakers minijack. For more information, see [“Sound System ”](#) (page 40).
- **Hard disks** An internal Ultra ATA /100 hard disk occupies one of four drive bays and functions as the default boot disk. Space is available in that bay for an auxiliary Ultra ATA /100 device. An internal Ultra ATA /66 device supports two more drives. Optional hard disk capacities are: 60 GB, 80 GB, 120 GB, and 180 GB. For more information, see [“Hard Disk Drives”](#) (page 33).
- **Optical disk drives** Two bays for storage devices with removable-media access through the front panel. For more information, see [“Optical Drives”](#) (page 34).
- **Headphone jack** The front panel includes a headphone jack. For more information, see [“Headphone Jack ”](#) (page 41).
- **Audio line-in** Rear panel audio line-in port for self-powered microphones or other audio equipment. For more information, see [“Audio Input Jack”](#) (page 40).
- **Audio line-out** Rear panel audio line-out port for externally-powered speakers or other audio devices. For more information, see [“Audio Output Jack ”](#) (page 42).
- **SuperDrive (DVD-R/CD-RW drive)** Some configurations of the PowerMac G4 computer have a SuperDrive drive. For more information, see [“SuperDrive”](#) (page 34).
- **Combo (DVD-ROM/CD-RW) drive** Some configurations of the PowerMac G4 computer have a combination DVD-ROM/CD-RW drive. For more information, see [“Combo \(DVD-ROM/CD-RW\) Drive”](#) (page 35).
- **USB ports** The computer has four USB ports: two on the enclosure and two on the keyboard. For more information, see [“USB Ports”](#) (page 27).
- **Ethernet** The computer has a built-in Ethernet port for 10Base-T, 100Base-T, or 1000Base-T Gigabit operation. The Ethernet port is auto-sensing and self-configuring to allow use of either a cross-over or straight-through cable. For more information, see [“Ethernet Port ”](#) (page 31).
- **Optional AirPort Extreme Card** Available as a build-to-order option, the 54 Mbps AirPort Extreme Card provides a wireless LAN connection. For more information, see [“Wireless LAN Module ”](#) (page 21).
- **Optional Bluetooth** Available as a build-to-order option, the fully-integrated Bluetooth module enables short-range wireless connections between desktop and laptop computers and a host of other peripheral devices. For more information, see [“Bluetooth Technology \(Optional\)”](#) (page 37).
- **FireWire ports** The computer has two FireWire 400 ports and one FireWire 800 port. For more information, see [“FireWire Controllers”](#) (page 22).
- **Modem** The computer has a built-in Apple 56 Kbps modem. The modem supports K56flex and V.90 and V.92 modem standards. For more information, see [“Internal Modem”](#) (page 35).

- **Keyboard** The computer comes with a full-size USB Apple Pro Keyboard. The keyboard is also a bus-powered USB hub with two USB ports. For more information, see [“Keyboard”](#) (page 38).
- **Mouse** The computer comes with a USB Apple Pro Mouse, with optical tracking. For more information, see [“Mouse”](#) (page 40).
- **PCI card expansion slots** The PowerMac G4 computer has four, 64 bit, 33 MHz expansion slots for PCI cards. For more information, see [“PCI Expansion Slots”](#) (page 49).
- **AGP 4x card slot** The computer is always shipped with an accelerated graphics card installed in this slot. For more information, see [“Accelerated Graphics Port Bus”](#) (page 20).
- **Voltage switching** Auto-ranging voltage switching accepts 100 - 240V.
- **Fan speed control** The speeds of the fans are thermally controlled and are automatically set as low as possible, to minimize noise. This is a function provided by the fans and is not controllable by user.
- **Energy saving** Sleep scheduling can be controlled via the Energy Saver pane in System Preferences.

Note: While in sleep mode, the computer emits no noise and the power light pulses slowly.

Features of the Enclosure

The PowerMac G4 computer's enclosure is a mini-tower design with opaque side panels and transparent handles. To access the main logic board to install PCI cards or additional memory, lift the latch and swing the side door down.

Warning: Opening the enclosure door disconnects the fan from the heat sink. Do not run the enclosure with the door open.

The front of the computer's enclosure has the speaker, media doors for the two removable media drives, the power button with power-on light, and a headphone jack.

The back panel includes the A/C power socket, the I/O ports, and the openings for I/O connectors on the PCI cards.

The enclosure has space for four hard disk drives and two optical devices. See [“Hard Disk Drives”](#) (page 33).

System Software

Initially, the PowerMac G4 computer ships with Mac OS X 10.2.3 installed as the default operating system; later in the release, it will ship with Mac OS X 10.2.4. The classic environment can be used to run Mac OS 9 applications.

Use the APIs IOKitLib and IOKit.framework to get information from I/O Registry Explorer.

Computer Identification

Rather than reading the box flag or the model string and then making assumptions about the computer's features, applications that need to find out the features of the computer should use the I/O Registry Explorer calls to test for the features they require.

Asset management software that reports the kind of computer it is run on can obtain the value of the property at `Devices:device-tree:compatible` in the IODeviceTree plane of the I/O Registry. The model string is the first program-usable string in the array of C strings in the `compatible` field. For the PowerMac G4, the value of the model property is `PowerMac3,6`.

Power-Saving Modes

The Power Manager is designed to implement a common power management strategy across all Macintosh models.

Processor States

The following processor states are defined:

- **Run:** The system is running at maximum processing capacity with all processors running at full speed.
- **Idle:** The system is idling; this is the default state. All clocks are running and the system can return to running code within a few nanoseconds. If the system has no work to do, it will be in idle mode.

System Modes

The Macintosh system has two power-saving modes. If the system does not support full sleep, it will use the less efficient doze mode. PCI cards that don't support full system sleep (some SCSI cards, some graphics cards) will cause the machine to doze rather than fully sleep.

- **Doze:** The power to the disk drive motors and the display is turned off, but the power supply and fans are still on. The computer cannot respond to network activity.
- **Full sleep:** The main power supply is shut down. A trickle supply provides auxiliary power to the PCI slots and keeps the DRAM state preserved for a quick recovery. All processors are powered off with their state preserved in DRAM. All clocks in the system are suspended except for the 32.768 KHz timebase crystal on the PMU99 IC. This mode allows the computer to meet the 5 W sleep requirement while providing the ability to start up without rebooting. This system may be awakened by administrative network packets, keyboard or mouse activity, USB device removal, or PMU scheduled wakeup.

Velocity Engine Acceleration

The Velocity Engine (an implementation of AltiVec) is the vector processing unit in the PowerPC G4 microprocessor. Some system software has been modified to take advantage of the accelerated processing that the Velocity Engine makes possible. System software has also been modified to support low-level operations using the Velocity Engine.

For complete information on the Velocity Engine, refer to the following Apple website:

<http://developer.apple.com/hardwaredrivers/ve/index.html>

Architecture

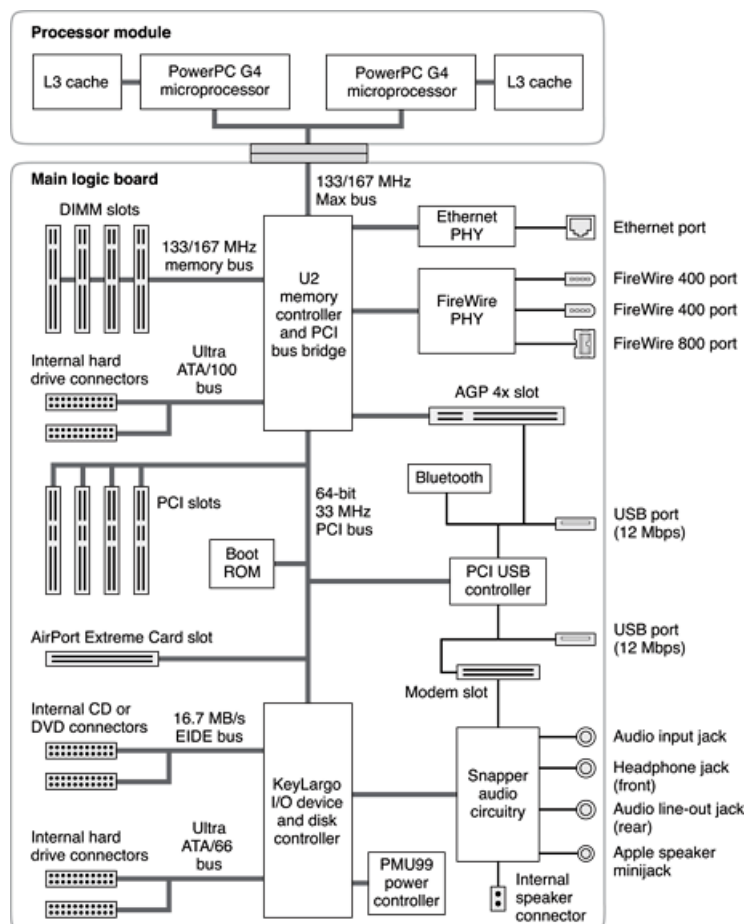

This chapter describes the architecture of the PowerMac G4 computer. It includes information about the major components on the logic boards: the microprocessor, the other main ICs, and the buses that connect them to each other and to the I/O interfaces.

Block Diagram and Buses

Figure 2-1 (page 17) is a simplified block diagram of the PowerMac G4 computer. The diagram shows the main ICs and the buses that connect them together.

The architecture of the PowerMac G4 computer is based on the PowerPC G4 microprocessor and two custom ICs: the U2 memory controller and bus bridge and the KeyLargo I/O controller.

Figure 2-1 Simplified block diagram

The PowerMac G4 computer has the following data buses, not counting the processor's dedicated interface to the backside cache.

- Processor bus: 133/167 MHz, 64-bit bus connecting the processor module to the U2 IC
- Memory bus: 133/167 MHz, 64-bit bus connecting the main DDR SDRAM memory to the U2 IC
- AGP-4x bus: 66 MHz, 32-bit bus connecting the AGP graphics card to the U2 IC
- PCI bus: 33 MHz, 64-bit bus supports the KeyLargo I/O controller, the boot ROM, the PCI slots, the U2 IC, and the USB controller
- Ultra ATA/100 and ATA/66 buses: supports internal hard drive connectors
- EIDE bus: Multiword DMA Mode 2 on ATA port 0 provides 16.7 MB/s to internal CD and DVD drive connectors

The remainder of this chapter describes the architecture of the processor module, the U2 memory controller and bridge IC, the KeyLargo I/O controller IC, and the USB controllers.

Processor Module

The processor module is a separate logic board that, depending on the configuration, contains one or two PowerPC G4 microprocessors and their external memory caches.

The processor module is connected to the main logic board by a 300-pin connector. To achieve the required level of performance, the signal lines that connect the processor module and the main logic board are carefully matched in length, loading, and impedance.

PowerPC G4 Microprocessor

The PowerPC G4 microprocessors used in the PowerMac G4 computer have many powerful features, including a pipelined system bus called MaxBus.

The PowerPC G4 used in the PowerMac G4 computer has the following features:

- 32-bit PowerPC implementation
- superscalar PowerPC core
- Velocity Engine (AltiVec technology): 128-bit-wide vector execution unit
- high bandwidth MaxBus with 36 address bits and 64 data bits
- fully symmetric multiprocessing capability
- dual 32 KB instruction and data caches (level 1)
- built-in 256 KB backside L2 cache
- support for up to 2 MB backside L3 cache
- on-chip L3 tag storage

For more information, see the reference at [“PowerPC G4 Microprocessor”](#) (page 51).

Cache Memory

In addition to the 256 KB level 2 (L2) cache built into the PowerPC G4 microprocessor, the processor module also has an external level 3 (L3) cache for each microprocessor. The L3 cache consists of 1 or 2 MB of double data rate (DDR) SDRAM. The clock frequency and clock ratio for the L3 cache are shown below.

	Clock Frequency (MHz)	Clock Ratio
1 GHz uP	250	4:1
1.25 GHz uP	250	5:1
1.42 GHz uP	236	6:1

U2 Bridge and Memory Controller

The U2 custom IC is at the heart of the PowerMac G4 computer. It provides the bridging functionality between the processors, the memory system, the PCI-based I/O system, the AGP slot, and the FireWire and Ethernet interfaces. It also provides the Ultra ATA/100 disk drive interface.

Processor Bus

The processor bus is a 133 or 167 MHz bus connecting the processor module to the U2 IC. The bus has 64-bit wide data and 32-bit wide addresses. The bus uses MaxBus protocols, supported by the U2 IC.

The MaxBus protocol includes enhancements that improve bus efficiency and throughput over the 60x bus. The enhancements include

- out-of-order completion
- address bus streaming
- intervention

Out-of-order completion allows the memory controller to optimize the data bus efficiency by transferring whichever data is ready, rather than having to pass data across the bus in the order the transactions were posted on the bus. This means that a fast DDR SDRAM read can pass a slow PCI read, potentially enabling the processor to do more before it has to wait on the PCI data.

Address-bus streaming allows a single master on the bus to issue multiple address transactions back-to-back. This means that a single master can post addresses at the rate of one every two clocks, rather than one every three clocks, as it is in the 60x bus protocol.

Intervention is a cache-coherency optimization that improves performance for dual-processor systems. If one processor modifies some data, that data first gets stored only in that processor's cache. If the other processor then wants that data, it needs to get the new modified values. In previous systems, the first processor must write the modified data to memory and then the second processor can read the correct values from memory. With intervention, the first processor sends the data directly to the second processor, reducing latency by a factor of ten or more.

Main Memory Bus

For the 1 GHz PowerMac G4 computer, the main memory bus connects the main memory to the U2 IC via a 133 MHz, 64-bit data bus. For the 1.25 GHz or 1.42 GHz configurations, the main memory bus connects the main memory to the U2 IC via a 167 MHz, 64-bit data bus. For the 1 GHz computer, the minimum speed DDR is 2x133 MHz, which is DDR 266 (PC2100). For the 1.25 GHz and 1.42 GHz computers, the minimum speed DDR is 2x167 MHz, which is DDR 333 (PC2700).

Main memory is provided by up to four 133 MHz DDR 266 or 167 MHz DDR 333 DIMMs using double data rate SDRAM devices. Supported DIMM sizes are 256 and 512 MB (also is 128 MB- and 1GB-capable). The memory slots accept four 512-MB DIMMs (also is capable of 2-1GB) for a maximum memory size of 2 GB. For more information about memory DIMMs, see [“RAM Expansion”](#) (page 47).

The address bus is connected to all four DIMM slots, so the total number of address bus loads to the controller IC can vary from one to eight. The data bus is connected through four switches, one for each DIMM slot. Only one switch is selected at a time, so the data bus presents either one or two loads, depending on whether the selected DIMM has one or two banks. The data switches have no drive capability; they are either low or high impedance, depending on whether they are selected or not.

Ultra ATA/100 Interface

The U2 IC implements a single Ultra ATA/100 hard disk interface and can accommodate one or two internal hard drives. For information about the drive bays, see [“Hard Disk Drives”](#) (page 33).

The KeyLargo IC provides DB-DMA (descriptor-based direct memory access) support for the Ultra ATA/66 interface.

Accelerated Graphics Port Bus

The accelerated graphics port (AGP) bus is a 66 MHz, 32-bit bus connecting the AGP card to the U2 IC. Data is transmitted at both edges of the clock and appears at a rate 4x the clock. The bus is an AGP-4x bus supporting peak transfers of 512 MB/s.

The AGP bus is a superset of the PCI bus, with the addition of separate address lines so it does not multiplex address and data when running in AGP mode. Having a separate address bus allows the AGP bus to pipeline addresses, thereby improving performance.

To further improve the performance of the AGP bus, the U2 IC supports a graphics address remapping table (GART). Because the virtual memory system organizes main memory as randomly distributed 4 KB pages, DMA transactions for more than 4 KB of data must perform scatter-gather operations. To avoid this necessity for AGP transactions, the GART is used by the AGP bridge in the U2 to translate a linear address space for AGP transactions into physical addresses in main memory.

For more information on the graphics cards installed in the AGP slot, refer to [“Graphics Cards”](#) (page 24).

Note: The AGP bus is 1.5 V only and is not backward compatible. Older AGP cards will not work in the PowerMac G4 computer.

PCI Bus

The 33-MHz, 64-bit PCI bus connects the U2 IC to the boot ROM, the KeyLargo I/O controller, the PCI slots, and the USB controllers. The U2 IC used in the PowerMac G4 computer supports the PCI write combining feature. This feature allows sequential write transactions involving the Memory Write or Memory Write and Invalidate commands to be combined into a single PCI transaction. The memory write transactions being combined must be sequential, ascending, and non-overlapping PCI addresses. Placing an eieio or sync command between the write commands prevents any write combining.

For more information on the PCI bus, refer to [“PCI Expansion Slots ”](#) (page 49).

Wireless LAN Module

The optional AirPort Extreme wireless LAN module connects via the PCI interface.

The AirPort Extreme Card wireless LAN module contains a media access controller (MAC), a digital signal processor (DSP), and a radio-frequency (RF) section. The module has a connector for the cable to the antennas, which are built into the computer’s case.

The AirPort Extreme Card is based on the IEEE draft specification of the 802.11g standard. The card transmits and receives data at up to 54 Mbps and is compatible with 802.11b-standard 11 Mbps systems and older 802.11b-standard systems. For information about its operation, see [“AirPort Extreme Card \(Optional\)”](#) (page 36).

The optional fully-integrated Bluetooth connectivity comes off the USB bus, see [“USB Interface ”](#) (page 23) and [“Bluetooth Technology \(Optional\)”](#) (page 37).

Modem Slot Support

The KeyLargo IC has a traditional Macintosh serial port and a USB port, however, modem support is via the USB controller rather than KeyLargo (see [“PCI USB Controller”](#) (page 22).

The KeyLargo IC provides DB-DMA (descriptor-based direct memory access) support for the modem slot interface.

The internal hardware modem is a separate module that contains a modem controller IC, a data pump, and the interface to the telephone line (DAA). For more information about the modem, see [“Internal Modem”](#) (page 35).

Boot ROM

The boot ROM consists of 1 MB of on-board flash EPROM. The boot ROM includes the hardware-specific code and tables needed to start up the computer using Open Firmware, to load an operating system, and to provide common hardware access services.

Ethernet Controller

The U2 IC includes an Ethernet media access controller (MAC). As a separate I/O channel on the U2 IC, it can operate at its full capacity without degrading the performance of other peripheral devices. The U2 IC provides DMA support for the Ethernet interface.

The MAC implements the link layer. It is connected to a PHY interface IC that provides 10-BaseT, 100-BaseT, or 1000-BaseT operation over a standard twisted-pair interface. The Ethernet port is auto-sensing and self-configuring to allow use of either a cross-over or straight-through cable. The operating speed of the link is automatically negotiated by the PHY and the bridge or router to which the Ethernet port is connected. For information about the port, see [“Ethernet Port”](#) (page 31).

FireWire Controllers

The U2 IC includes an IEEE 1394b FireWire 800 controller with a maximum data rate of 800 Mbps (100 MBps). The IC is backwards-compatible with 1394a and FireWire 400. The U2 IC provides DMA (direct memory access) support for the FireWire interface.

The controller in the U2 IC implements the FireWire link layer. A physical layer IC, called a PHY, implements the electrical signaling protocol of the FireWire interface and provides the electrical signals to the ports. For more information, see [“FireWire Ports”](#) (page 28).

PCI USB Controller

The PowerMac G4 CPU uses a PCI USB controller ASIC with two Open Host Controller Interface (OHCI) functions. One controller has three ports supporting the USB signal pair on the internal AGP slot, internal Bluetooth (build-to-order option), and a 12 Mbps rear panel USB port. The second controller has two ports supporting the internal USB modem and a 12 Mbps rear panel USB port.

The USB ports comply with the Universal Serial Bus Specification 1.1 Final Draft Revision. The USB register set complies with the Open Host Controller Interface (OHCI) specification. For more information, see [“USB Ports”](#) (page 27).

KeyLargo I/O Controller

The KeyLargo custom IC is the third major component of the architecture. It provides all the I/O functions except Ethernet, FireWire, and USB functions. The KeyLargo IC provides an Ultra ATA/66 (ATA-66 UDMA Mode 4 and Multiword DMA Mode 4), an EIDE interface, and support for the sound IC.

DMA Support

The KeyLargo IC provides DB-DMA (descriptor-based direct memory access) support for the following I/O channels:

- Ultra ATA/66

- EIDE interface
- Communication slot interface
- IIS channel to the sound subsystem

The DB-DMA system provides a scatter-gather process based on memory-resident data structures that describe the data transfers. The DMA engine is enhanced to allow bursting of data files for improved performance.

Interrupt Support

The interrupt controller for the PowerMac G4 system is an MPIC cell in the KeyLargo IC. In addition to accepting all the KeyLargo internal interrupt sources, the MPIC controller accepts external interrupts from dedicated interrupt pins and serial interrupts from the U2 serial interrupt stream. The signals from the U2 IC are synchronized to the operation of the MPIC circuitry, so there is no additional interrupt latency on the U2 interrupts.

USB Interface

The KeyLargo IC has two independent USB root hubs, which are not connected in the PowerMac G4. Application code that was targeted to these ports in previous models of the PowerMac G4 will not work in this version.

The USB interface is via the PCI USB controller; see [“PCI USB Controller”](#) (page 22).

Ultra ATA/66 Interface

The KeyLargo IC implements a single Ultra ATA/66 hard disk interface. This interface can accommodate one or two internal hard drives. The KeyLargo IC provides DB-DMA (descriptor-based direct memory access) support for the Ultra ATA/66 interface.

For information about the drive bays, see [“Hard Disk Drives”](#) (page 33).

Enhanced IDE Interface

In the PowerMac G4 computer, the KeyLargo IC provides an enhanced IDE (EIDE) interface. The EIDE interface supports the removable media drives mounted behind the front panel, an optical drive, and second optical drive.

For information about specific drives, see [“Optical Drives”](#) (page 34).

The KeyLargo IC provides DB-DMA (descriptor-based direct memory access) support for the EIDE interface.

Sound Circuitry

The sound circuitry, called *Snapper*, is connected to the KeyLargo IC by a standard IIS (inter-IC sound) bus. The KeyLargo IC provides DB-DMA (descriptor-based direct memory access) support for the IIS port.

The core of the Snapper circuitry is an IC that performs digital audio processing and codec functions. The digital audio processing functions include output equalization, dynamic range compression, and volume control. The equalization and dynamic range control functions are set to fixed values to equalize a set of Apple Pro Speakers and the internal speakers. Those functions are bypassed for signals sent to the audio output jacks.

The codec functions include one stereo input pair and three stereo output pairs.

Stereo signals from the audio input jack are routed to an analog line input buffer that drives the internal A/D converter.

Digital audio data from the KeyLargo IC drives the internal D/A converter. Analog audio signals from the D/A converter are routed to the headphone jack, the line output jack, and an audio power amplifier.

The audio power amplifier drives the internal speaker, the Apple Pro Speakers, and front headphone. When Apple Pro Speakers are connected to the external speaker jack or headphones are installed, the internal speaker is muted.

For a description of the features of the sound system, see [“Sound System”](#) (page 40).

Power Controller

The power management controller in the PowerMac G4 computer is a microcontroller called the PMU99. It supports new modes of power management that provide significantly lower power consumption than previous systems. For more information, see [“Power-Saving Modes”](#) (page 14).

Graphics Cards

The PowerMac G4 computer comes with a graphics card installed in the 4x-AGP slot. The graphics cards are available, as shown below:

Graphics IC	Video RAM	Connectors
NVidia GeForce4 MX	64 MB DDR	ADC and DVI
NVidia GeForce4 Titanium (build-to-order)	128 MB DDR	ADC and DVI
ATI Radeon 9000 Pro	64 MB DDR	ADC and DVI
ATI Radeon 9700 Pro (build-to-order)	128 MB DDR	ADC and DVI

All graphics cards support dual displays in either extended desktop or video mirroring mode, and support digital resolutions up to 1920x1200 pixels and analog resolutions up to 1600x1200 pixels.

The NVidia GeForce4 Titanium card and ATI Radeon 9700 Pro card are available as build-to-order options.

The display memory on the AGP card is separate from the main memory. The display memory consists of 64 or 128 MB of DDR devices configured to make a 128-bit data bus. The display memory cannot be expanded by the user.

The digital flat-panel display can have pixel depths of 8, 16, or 32 for a display up to 1920 by 1200 pixels.

An analog monitor can be connected to the DVI connector by means of a DVI to VGA adapter cable. The analog monitor display can have pixel depths of 8, 16, or 32 bpp for all displays up to 2048 by 1536 pixels at a refresh rate of 75 Hz.

For more information about the features of the graphics cards and the monitors they support, see [“Video Monitor Ports”](#) (page 43).

Input and Output Devices

This chapter describes the PowerMac G4 computer’s built-in I/O devices and the ports for connecting external I/O devices. Each of the following sections describes an I/O port or device.

USB Ports

The PowerMac G4 computer has two external Universal Serial Bus (USB) ports on the back and two on the keyboard. The USB ports are used for connecting the keyboard and mouse as well as additional I/O devices such as printers, scanners, and low-speed storage devices. The USB ports are off of the USB controller connected to the PCI bus.

Each USB port is connected to a separate USB root hub, allowing both USB ports to support 12 Mbps devices at the same time with no degradation of their performance. The USB root hubs also connect to the internal USB modem and Bluetooth modules and to the USB port on the ADC monitor connector.

The USB ports comply with the Universal Serial Bus Specification 1.1 Final Draft Revision. The USB register set complies with the Open Host Controller Interface (OHCI) specification.

For more information about USB on Macintosh computers, please refer to Apple Computer’s *Mac OS USB DDK API Reference* and the other sources listed in “[USB Interface](#)” (page 53).

USB Connectors

The USB ports use USB Type A connectors, which have four pins each. Two of the pins are used for power and two for data. [Figure 3-1](#) (page 27) shows the connector and [Table 3-1](#) (page 27) shows the signals and pin assignments.

Figure 3-1 USB connector

Table 3-1 Signals on the USB connector

Pin	Signal name	Description
1	VCC	+5 VDC
2	D–	Data –

Pin	Signal name	Description
3	D+	Data +
4	GND	Ground

The PowerMac G4 computer provides power for the USB ports at 5 V and up to 500 mA on each port. The ports share the same power supply; a short circuit on one disables both ports until the short has been removed.

The USB ports support both low-speed and high-speed data transfers, at 1.5 Mbits per second and 12 Mbits per second, respectively. High-speed operation requires the use of shielded cables.

The Macintosh system software supports all four data transfer types defined in the USB specification.

Waking Up From Sleep

As defined in the USB-suspend mode of the USB specification, USB devices can provide a remote wakeup function for the computer. The USB root hub in the computer is set to support remote wakeup whenever a device is attached to the bus. The device wakes the computer by sending a Resume event to the USB root hub. The mouse and keyboard that come with the computer use this method to wake the computer on a key press or mouse click.

FireWire Ports

The PowerMac G4 computer has one FireWire 800 IEEE 1394b port and two FireWire 400 IEEE 1394a ports. Each FireWire port

- supports booting the system from a mass storage device
- supports target disk mode
- provides bus repeating capability as long as the computer is connected to AC power

The three FireWire ports share a single power supply that can provide up to 15 watts total. The three ports are all on the same FireWire bus and can connect to up to 62 other FireWire devices.

The FireWire hardware and software provided with the PowerMac G4 computer are capable of all asynchronous and isochronous transfers defined by IEEE standard 1394a and 1394b.

Developers of FireWire peripherals are required to provide device drivers. A driver for DV (digital video) is included in QuickTime 4.0 and later versions.

Note: FireWire cables are not included with this product and must be purchased independently, if required.

For more information about FireWire on Macintosh computers, please refer to the Apple FireWire website and the other sources listed in [“FireWire Interface”](#) (page 54).

FireWire 800 Connector

The FireWire 800 port on the PowerMac G4 computer is based on IEEE 1394b and enables a 800 Mbps transfer rate. FireWire 800 uses a 9-pin connector and is backwards compatible with original 1394 FireWire devices with 6-pin or 4-pin connectors. With the appropriate cable, the 9-pin port works seamlessly with legacy FireWire devices. Cables are available to go from both 6-pin and 4-pin connectors to a 9-pin, and 9-pin to 9-pin.

Note: FireWire adapter cables are not included in the package.

The 9-pin FireWire 800 connector is shown in [Figure 3-2](#) (page 29). Its connector signals and pin assignments are shown in [Table 3-2](#) (page 29).

Figure 3-2 9-pin FireWire 800 connector

Table 3-2 Signals on the 9-pin FireWire 800 connector

Pin	Signal name	Description
1	TPB–	Twisted-pair B Minus
2	TPB+	Twisted-pair B Plus
3	TPA–	Twisted-pair A Minus
4	TPA+	Twisted-pair A Plus
5	TPA (R)	Twisted-pair A Ground Reference
6	VG	Power Ground
7	SC	Status Contact (no connection; reserved)
8	VP	Power Voltage (approximately 25 V DC)
9	TPB (R)	Twisted-pair B Ground Reference

VP (pin 8) provides up to 15 W power, shared with the other FireWire connectors. The voltage on the power pin is approximately 25 V.

The 9-pin FireWire port is capable of operating at 100, 200, 400, and 800 Mbps, depending on the device it is connected to. Using a cable with a 9-pin connector at one end and a 4-pin or 6-pin connector at the other, the 9-pin port is capable of directly connecting to all existing FireWire devices. Using a cable with 9-pin connectors at both ends, the 9-pin port is capable of operating at 800 Mbps.

The IEEE 1394b standard defines long-haul media using Cat 5 UTP and several kinds of optical fiber. The PowerMac G4 computer is interoperable with such cables but cannot be directly connected to them. To use long-haul cables, connect the computer to a 1394b hub that has the desired kind of long-haul connectors. If the hub has a bilingual port, that port can be connected to any of the computer's FireWire ports. If the hub has a beta-only port, it can be connected only to the computer's 9-pin port.

FireWire 400 Connector

The FireWire 400 ports 1 and 2 use the six-pin connectors shown in [Figure 3-3](#) (page 30). The connector signals and pin assignments are shown in [Table 3-3](#) (page 30).

Figure 3-3 6-pin FireWire 400 connector

Table 3-3 Signals on the 6-pin FireWire 400 connector

Pin	Signal name	Description
1	Power	Power (approximately 25 V DC)
2	Ground	Ground return for power and inner cable shield
3	TPB–	Twisted-pair B Minus
4	TPB+	Twisted-pair B Plus
5	TPA–	Twisted-pair A Minus
6	TPA+	Twisted-pair A Plus
Shell	—	Outer cable shield

The power pin provides up to 15 W total power, shared with the other FireWire connectors. The voltage on the power pin is approximately 25 V.

Pin 2 of the 6-pin FireWire connector is ground return for both power and the inner cable shield. In a FireWire cable with a 4-pin connector on the other end, the wire from pin 2 is connected to the shell of the 4-pin connector.

The signal pairs are crossed in the cable itself so that pins 5 and 6 at one end of the cable connect with pins 3 and 4 at the other end. When transmitting, pins 3 and 4 carry data and pins 5 and 6 carry clock; when receiving, the reverse is true.

Booting from a FireWire Device

The PowerMac G4 computer can boot from a FireWire storage device that implements SBP-2 (Serial Bus Protocol) with the RBC (reduced block commands) command set. Detailed information is available from Developer Technical Support at dts@apple.com.

For additional information about the FireWire interface and the Apple API for FireWire device control, see the references shown in [“FireWire Interface”](#) (page 54).

Target Disk Mode

The user has the option at boot time to put the computer into a mode of operation called Target Disk Mode (TDM). When the PowerMac G4 computer is in Target Disk Mode and connected to another Macintosh computer by a FireWire cable, the PowerMac G4 computer operates like a FireWire mass storage device with the SBP-2 (Serial Bus Protocol) standard. Target Disk Mode has two primary uses:

- high-speed data transfer between computers
- diagnosis and repair of a corrupted internal hard drive

The PowerMac G4 computer can operate in Target Disk Mode as long as the other computer has a 1394a or 1394b FireWire port and either any version of Mac OS X or Mac OS 9 with FireWire software version 2.3.3 or later.

To put the PowerMac G4 computer into Target Disk Mode, restart the computer and hold down the T key until the FireWire icon appears on the display. Then connect a FireWire cable from the PowerMac G4 to the other computer. When the other computer completes the FireWire connection, a hard disk icon appears on its desktop.

If you disconnect the FireWire cable or turn off the PowerMac G4 computer while in Target Disk Mode, an alert appears on the other computer.

To take the PowerMac G4 out of Target Disk Mode, drag the hard disk icon on the other computer to the trash, then press the power button on the PowerMac G4 computer.

Ethernet Port

The PowerMac G4 computer has a built-in Ethernet port that supports 10Base-T, 100Base-T, and 1000Base-T Gigabit transfer rates. In operation, the actual speed of the link is auto-negotiated between the computer's PHY device and the hub, switch, or router to which it is connected. The Ethernet port is auto-sensing and self-configuring to allow connection via either a cross-over or straight-through cable.

Both CAT 5 unshielded twisted pair (UTP) and shielded twisted pair (STP) cables work with the Ethernet port. An STP cable is recommended for noisy environments or run of greater than 100 meters.

Note: When connecting a PowerMac G4 computer directly to another computer without using an Ethernet hub, a crossover cable is not required; circuits in the PHY detect the type of connection and switch the signal configuration as required.

The connector for the Ethernet port is an RJ-45 connector on the back of the computer. [Table 3-4](#) (page 32) shows the signals and pin assignments for 10Base-T and 100Base-T operation. [Table 3-5](#) (page 32) shows the signals and pin assignments for 1000Base-T operation.

Table 3-4 Signals for 10Base-T and 100Base-T operation

Pin	Signal name	Signal definition
1	TXP	Transmit (positive lead)
2	TXN	Transmit (negative lead)
3	RXP	Receive (positive lead)
4	–	Not used
5	–	Not used
6	RXN	Receive (negative lead)
7	–	Not used
8	–	Not used

Table 3-5 Signals for 1000Base-T Gigabit operation

Pin	Signal name	Signal definition
1	TRD+(0)	Transmit and receive data 0 (positive lead)
2	TRD–(0)	Transmit and receive data 0 (negative lead)
3	TRD+(1)	Transmit and receive data 1 (positive lead)
4	TRD+(2)	Transmit and receive data 2 (positive lead)
5	TRD–(2)	Transmit and receive data 2 (negative lead)
6	TRD–(1)	Transmit and receive data 1 (negative lead)
7	TRD+(3)	Transmit and receive data 3 (positive lead)
8	TRD–(3)	Transmit and receive data 3 (negative lead)

To interconnect two computers for 1000Base-T operation, you must use 4-pair cable (Category 5 or 6).

The Ethernet interface in the PowerMac G4 computer conforms to the ISO/IEC 802.3 specification, where applicable, and complies with IEEE specifications 802.3i (10Base-T), 802.3u-1995 (100Base-T), and 802.3ab (1000Base-T).

Disk Drives

The PowerMac G4 computer has two 5.25 inch bays for optical drive access through the front panel and four 3.5 inch bays for internal hard disk drives, two in the front and two in the back. The optical drives are on the EIDE data bus.

The PowerMac G4 computer supports ATA and ATAPI internal storage devices that are set for cable select mode, which force the devices to set their IDs based cable position. When transferring a drive to the PowerMac G4 from older computers, be sure to set the cable select on the drive. For additional information on cable select, refer to the following website.

http://www.seagate.com/support/kb/disc/faq/ata_cable_select.html

Note: Some non-Apple cables may not correctly support cable select mode.

Note: If two removable media drives are installed, press Option-Eject to eject the disk on the second drive.

Hard Disk Drives

The enclosure has two drive carriers, each with two 3.5 inch bays for fixed-media mass storage devices. The rear drive carrier includes data and power connectors for the boot drive and a second internal drive on the Ultra ATA/100 interface. The front drive carrier has data and power connectors for one or two additional drives on the Ultra ATA/66 interface. A drive in either of the internal carriers can also be connected to an optional PCI controller card.

The boot drive occupies one of the bays in the rear carrier and is connected by way of an Ultra ATA/100 (ATA-5) interface. The Ultra ATA/100 cable assembly also has data and power connectors for a second 3.5 x 1-inch drive in the rear carrier.

The drives on the Ultra ATA/100 bus operate in a Device 0/1 configuration. The boot drive is cable-selected as Device 0 (master). An additional Ultra ATA/100 is configured as Device 1 (slave).

Like the drives on the Ultra ATA/100 bus, the drives on the Ultra ATA/66 bus operate in a Device 0/1 configuration. The Ultra ATA/66 bus supports PIO Mode 4, DMA Mode 2, and Ultra DMA Mode 4 data transfers.

SCSI Drive

SCSI drives and SCSI PCI controller cards are available from third party providers. The PowerMac G4 computer supports one to four SCSI drives.

Optical Drives

The optical drives are connected by way of an EIDE (ATA-3) interface.

The two optical drives occupy both device locations on the IDE channel. The devices operate in an IDE Device 0/1 configuration. The upper optical drive is Device 0 (master) and the lower drive is Device 1 (slave). Power and data cables are provided for both bays even if only one bay is occupied.

The EIDE bus supports PIO Mode 4 and MultiWord DMA Mode 4 data transfers.

SuperDrive

Some configurations of the PowerMac G4 computer have a SuperDrive (combination DVD-R and CD-RW drive). The SuperDrive has a tray for loading the disc.

The SuperDrive can read and write DVD media and CD media, as shown in [Table 3-6](#) (page 34). The DVD-R/CD-RW drive also provides DVD-Video playback. (The G4 microprocessor provides the MPEG 2 decoding.)

Table 3-6 Media read and written by the SuperDrive

Media type	Reading speed (maximum)	Writing speed
DVD-R	2x (CLV)	4x/2x/1x (CLV) depending on media type — see text below table
DVD-ROM	8x (CAV max)	—
CD-R	32x (CAV max)	16x (CLV)
CD-RW	16x (CAV max)	8x (CLV) high speed CD-RW disc
CD or CD-ROM	32x (CAV max)	—

For the 4x SuperDrive, the media compares as follows.

- the following qualified 4x media burns at up to 4x:

Maxell	MCC/Verbatim
Pioneer Video	Taiyo Yuden
TDK	MCI (Mitsui)
Fuji	

- the following qualified 2x media burns at up to 2x:

Maxell	MCC/Verbatim
Pioneer Video	Taiyo Yuden
TDK	Sony

- burn speeds for other media may vary

For 2x SuperDrive, it is recommended to continue using 2x media.

The Apple SuperDrive writes to DVD-R 4.7 gigabyte General Use media. These discs are playable in most standard DVD players and computer DVD-ROM drives. For a list of players tested by Apple for playability, refer to

<http://www.apple.com/dvd/compatibility/>

For compatibility information regarding recordable DVD formats, refer to

<http://dvddemystified.com/dvdfaq.html#4.3>

Digital audio signals from the SuperDrive can be played through the sound outputs under the control of the Sound Manager.

The SuperDrive is an ATAPI drive and is cable-select enabled such that Device 0 master and Device 1 is slave.

Combo (DVD-ROM/CD-RW) Drive

Some configurations of the PowerMac G4 computer have a combination DVD-ROM and CD-RW drive. The drive has a tray for loading the disc.

The Combo drive can read DVD media and read and write CD media, as shown in [Table 3-7](#) (page 35). The DVD-ROM/CD-RW drive also provides DVD-Video playback. (The G4 microprocessor provides the MPEG 2 decoding.)

Table 3-7 Media read and written by the Combo drive

Media type	Reading speed	Writing speed
DVD-R	4x (CAV max)	–
DVD-ROM	12x (CAV max)	–
CD-R	32x (CAV max)	32x (ZCLV)
CD-RW	20x (ZCAV max)	10x (CLV, for high speed media)
CD or CD-ROM	32x (CAV max)	–

Digital audio signals from the Combo drive can be played through the sound outputs under the control of the Sound Manager.

Internal Modem

The PowerMac G4 computer has an internal modem module. The external I/O connector for the modem is an RJ-11 connector installed on the rear panel of the computer. The modem has the following features:

- modem bit rates up to 56 Kbps, supports K56flex modem standard and V.90 and V.92 for the Dash 2 modem
- fax modem bit rates up to 14.4 Kbps

The modem appears to the system as a USB device that responds to the typical AT commands. The modem provides a sound output for monitoring the progress of the modem connection.

AirPort Extreme Card (Optional)

The PowerMac G4 computer supports the AirPort Extreme Card, an internal wireless LAN module. The AirPort Extreme Card is available as a build-to-order option or as a user-installable upgrade through the Apple Store.

By communicating wirelessly with a base station, the AirPort Extreme Card can be used for Internet access, email access, and file exchange. A base station provides the connection to the Internet or the bridge between the wireless signals and a wired LAN or both. The AirPort Extreme Base Station has connectors for a wired LAN, a DSL or cable modem, and a standard telephone line using the built-in 56 Kbps modem that is available on some base stations.

AirPort Extreme transmits and receives data at speeds up to 54 Mbps, comparable to wired networking speeds. AirPort Extreme is also compatible with other devices that follow the IEEE 802.11b standard, including PC's. For more information about Wi-Fi and compatibility, see the reference at ["Wireless Networks"](#) (page 54).

Note: As is the case with the existing IEEE 802.11b standard, actual data throughput speeds will be lower than the indicated maximum connection speeds. Inherent in wireless LAN systems, bandwidth overhead is required for wireless routing, scrambling, security error correction, and other processes.

Data Security

AirPort Extreme has several features designed to maintain the security of the user's data:

- The system uses direct-sequence spread-spectrum (DSSS) technology that uses a multibit spreading code that effectively scrambles the data for any receiver that lacks the corresponding code.
- The system can use an Access Control List of authentic network client ID values (wireless and MAC Addresses) to verify each client's identity before granting access to the network.
- When communicating with a base station, AirPort Extreme uses up to 128-bit encryption to encode data while it is in transit.
- The AirPort Extreme Base Station can be configured to use NAT (Network Address Translation), protecting data from would-be Internet hackers.
- The AirPort Extreme Base Station can authenticate users by their unique Ethernet IDs, preventing unauthorized computers from logging into a network. Network administrators can take advantage of RADIUS compatibility, used for authenticating users over a remote server. Smaller networks can offer the same security using a local look-up table located within the base station.

As an additional data security measure, VPN can be used in conjunction with the AirPort Extreme data security.

AirPort Extreme Hardware

The AirPort Extreme Card is a wireless LAN module based on the IEEE draft specification of the 802.11g standard using both OFDM (orthogonal frequency-division multiplexing) and DSSS technologies. Using DSSS, AirPort Extreme is interoperable with PC-compatible wireless LANs that conform to the 802.11b standard at speeds of 11 Mbps, 5.5 Mbps, 2 Mbps, and 1 Mbps. Using OFDM, AirPort Extreme is compatible with all 802.11g draft standard speeds.

Two AirPort Extreme antennas are built into the computer's enclosure. One antenna is always used for transmitting. Either of the two antennas may be used for receiving. Using a diversity technique, the AirPort Extreme Card selects the antenna that gives the best reception. AirPort Extreme shares the antennas with Bluetooth.

The AirPort Extreme wireless LAN is on the PCI bus.

AirPort Extreme Software

Software that is provided with the AirPort Extreme Card includes

- AirPort Extreme Setup Assistant, an easy-to-use program that guides the user through the steps necessary to set up the AirPort Extreme Card or set up an AirPort Extreme Base Station.
- Users can switch between wireless networks and can create and join peer-to-peer networks. These functions are accessed via the AirPort Extreme- Menu-Extra pulldown in System Preferences.
- AirPort Extreme Admin Utility, a utility for advanced users and system administrators. With it the user can edit the administrative and advanced settings needed for some advanced configurations.

Bluetooth Technology (Optional)

Available as a fully integrated build-to-order option, Bluetooth is an open specification that enables short-range wireless connections between desktop and laptop computers and a host of other peripheral devices. Bluetooth support is built into Mac OS X and compliant with Bluetooth specification v1.1. It operates on a globally available 2.4 GHz frequency band (ISM band) for worldwide compatibility and has a maximum throughput of 1Mbps.

The Bluetooth technology supports the following profiles:

- synchronization —enables synchronization of devices over Bluetooth
- serial —provides a wireless serial connection to other Bluetooth devices
- dial-up networking (DUN) — enables a mobile phone to act as a modem
- object push —enables the transfer of files between Bluetooth devices

Bluetooth is available as a build-to-order option, which is installed by Apple at the time of purchase as a fully integrated module. Accessing the Bluetooth capabilities without purchasing the integrated module will require a third-party dongle.

For more information on Bluetooth technology, refer to [“Bluetooth”](#) (page 54).

Keyboard

The PowerMac G4 computer comes with a Apple Pro Keyboard. It is a full-size keyboard with function keys and separate keypad and editing sections.

The keyboard has an attached 1-meter cable and comes with a 1-meter extender cable for installations where the computer is located on the floor or away from the immediate desktop area.

Keyboard Features

Here is a list of the features of the Apple Pro Keyboard.

- slope settable to either 0 or 6 degrees
- 108 keys (on the ANSI versions)
- 15 function keys
- 6 editing keys (Page Up, Page Down, Home, End, Forward Delete, and Help)
- USB HID Consumer Page Usage multimedia control keys
- full travel, standard pitch keys on alphanumeric, editing, and keypad sections, including function keys and cursor-position keys
- localized worldwide: 33 versions, standard layouts (including: ANSI, JIS, ISO)
- LED indicators in the Caps Lock and Num Lock keys
- USB hub functionality with two USB sockets

Note: There is no power key on this keyboard.

Keyboard Layout

There are localized versions of the Apple Pro Keyboard for use in different parts of the world. The three standards used are ANSI (US and North America), JIS (Japan), and ISO (Europe).

Applications can determine which keyboard is connected by calling the Gestalt Manager and checking for the corresponding value of the `gestaltKeyboardType` selector:

- `gestaltUSBAndyANSIKbd` (value = 204)
- `gestaltUSBAndyISOKbd` (value = 205)
- `gestaltUSBAndyJISKbd` (value = 206)

[Figure 3-4](#) (page 39) shows the keyboard layout for the ANSI keyboard.

Figure 3-4 NSI keyboard layout

MultiMedia Control Keys

The keyboard has six multimedia keys: Volume Up, Volume Down, Mute, Brightness Up (F15), Brightness Down (F14), and Eject. These keys provide direct control of the features on the computer by way of the USB.

If two removable media drives are installed, press Option-Eject to eject the disk on the second drive in the bottom drive bay.

Keyboard and USB

The Apple Pro Keyboard is designed to work with the computer by way of the USB ports. The keyboard has a captive cable with a USB Type A connector. The keyboard is a bus-powered USB hub with two USB Type A ports.

Warning: A bus-powered hub as defined in the USB specification does not provide enough power to support a second bus-powered hub. A second bus-powered hub must be connected to the second USB port on the computer, not to a port on the keyboard.

Apple provides a HID class driver for the Apple Pro Keyboard, which supports the USB boot protocol. Other keyboards intended for use on the Macintosh platform must support the HID boot protocol, as defined in the USB Device Class Definition for Human Interface Devices (HIDs).

Programmer's Switches

Key combinations for programmer's switches that used the Power button on earlier models now use the Eject key. Here are the key combinations for the PowerMac G4 computer.

- Control-Command-Eject: restart immediately (reset)
- Control-Command-Option-Eject: shut down immediately
- Control-Eject: display the dialog for shutdown, restart, and sleep

The key combinations are decoded in software and may not be available under some crashed conditions.

Mouse

The PowerMac G4 computer comes with an Apple Pro Mouse. The mouse case is made of polycarbonate plastic like the computer.

The Apple Pro Mouse is a new design that uses optical tracking in place of the traditional rolling ball. It works on almost any surface, though nonreflective, opaque surfaces without repetitive patterns work best. In Mac OS X, the new Apple Pro Mouse resolution is switched to 800dpi and the xy displacement data are signed 16-bit values.

Sound System

Under the control of the system software, the sound circuitry can create and record sounds digitally. It can receive audio signals through the audio input jack and send audio signals to the internal speaker, the headphone jack, the audio output jack, and the Apple speaker minijack.

Audio signals from the audio input jack are converted to digital data internally. All audio is handled digitally inside the computer, including audio data from the CD or DVD drive and from devices connected to the USB and FireWire ports. Audio data is converted to analog form for output to the internal speaker, the headphone and line output jacks, and the Apple Pro Speaker minijack.

The sound circuitry handles audio data as 44.1 kHz, 16-bit samples. If audio data sampled at a lower rate on another computer is played as output, the Sound Manager transparently upsamples the data to 44.1 kHz prior to sending the audio data to the sound circuitry.

Plugging-in some components in the sound system mutes other components, as shown below:

When Plug-In:	This Is Muted:
External speakers	Internal speakers
Rear line-out	Internal and external speakers
Front headphone	Internal and external speakers

Note: The rear line-out jack is never muted.

Audio Input Jack

The PowerMac G4 has a stereo audio line-in jack on the back panel. Low level consumer products operating below -10 dbu require a pre-amp.

The audio inputs are designed to accept high-level audio signals: 2 Vrms or +8 dbu, which is the standard output level from CD and DVD players. The output level of some consumer audio devices is lower, often 0.316 Vrms or –10 dBV. Sound recordings made on the PowerMac G4 with such low-level devices have more noise than those made with high-level devices. The user may obtain better results by connecting an amplifier between the low-level device and the computer's audio input jack.

The audio input jack is a 3.5 mm miniature phone jack with the signals connected as follows:

Tip	Left-channel audio
Ring	Right-channel audio
Sleeve	Audio ground

The sound input jack has the following electrical characteristics:

- maximum input signal amplitude 2 Vrms (5.65 Vpp), +8 dbu peak
- input impedance at least 47 kilohms
- channel separation greater than 75 dB
- recommended source impedance 2 kilohms or less
- ground noise rejection greater than 75 dB
- frequency response 20 Hz to 20 kHz, +0.5, –1.5 dB
- distortion below –80 dB
- signal to noise ratio (SNR) greater than 85 dB (unweighted)

Headphone Jack

The PowerMac G4 has a stereo headphone jack on the front of the enclosure. The headphone jack is suitable for connecting a pair of headphones or amplified external speakers. When a plug is inserted into the headphone jack, the internal speaker and the Apple Pro Speakers (if connected) are muted.

The sound input jack is a 3.5 mm miniature phone jack with the signals connected as follows:

Tip	Left-channel audio
Ring	Right-channel audio
Sleeve	Audio ground

Note: Do not plug headphones into the rear line-out jack. Headphone impedance is 32 ohms and line-out impedance is 1 kilohm.

The headphone jack has the following electrical characteristics:

- full-scale output level (open circuit) 1.5 Vrms (4.5 Vpp), +4 dbu peak

- source impedance is 10 ohms
- channel separation greater than 65 dB
- recommended load impedance 32 ohms or greater
- distortion, 32 ohm load, is better than –80 dB (0.01%)
- frequency response, 32 ohm load, 20 Hz to 20 kHz, +0.5, –1.5 dB
- signal-to-noise ratio (SNR) greater than 90 dB unweighted

Audio Output Jack

The PowerMac G4 has a stereo output jack on the back of the enclosure. The audio output jack is suitable for connecting amplified external speakers.

The audio output jack is a 3.5 mm miniature phone jack with the signals connected as follows:

Tip	Left-channel audio
Ring	Right-channel audio
Sleeve	Audio ground

Note: Do not plug line-out devices into headphone jack. Headphone impedance is 32 ohms and line-out impedance is 1 kilohm.

The audio output jack has the following electrical characteristics:

- full-scale output level (open circuit) 1.5 Vrms (4.5 Vpp), +4 dbu peak
- source impedance less than 10 ohms
- channel separation greater than 70 dB
- recommended load impedance 1 kilohm or greater
- distortion is –80 dB (0.01%)
- frequency response, with 10 kilohms load, 20 Hz to 20 kHz, +0.5, –1.5 dB
- signal-to-noise ratio (SNR) greater than 90 dB

Apple Pro Speakers Minijack

The Apple Pro Speakers minijack is a stereo 2.5 mm miniature jack. It has a smaller diameter than the headphone jack so that the user cannot inadvertently plug headphones into it.

Warning: Some types of headphones and other audio devices have a 2.5 mm plug. The user should be warned not to plug such devices into the Apple Pro Speakers minijack. Doing so could cause damage to the devices.

The electrical characteristics of the Apple Pro Speakers minijack are optimized for use with Apple Pro Speakers. The Apple Pro Speakers include an internal ROM that enables the computer to identify the speakers. Speakers other than the Apple Pro Speakers should not be connected to the Apple Pro Speakers minijack.

Video Monitor Ports

Depending on the configuration, the PowerMac G4 computer comes with either an ATI or an NVidia graphics card installed. The main features of the graphics cards are as follows:

Graphics IC	Video RAM	Connectors
ATI Radeon 9000 Pro	64 MB DDR	ADC and DVI
NVidia GeForce4 MX	64 MB DDR	ADC and DVI

The NVidia GeForce4 Titanium 128 MB DDR, ADC/DVI graphics card and ATI Radeon 9700 Pro 128 MB DDR, ADC/DVI graphics card are available as build-to-order options.

All of the graphics cards support dual displays in either extended desktop or video mirroring mode.

The following sections describe the video connectors on the graphics cards.

Apple Display Connector

The graphics cards have an Apple proprietary connector called the ADC (Apple display connector). The connector carries both digital and analog video signals as well as USB and control signals and power for an external monitor. [Figure 3-5](#) (page 43) shows the contact configuration; [Table 3-8](#) (page 44) and [Table 3-9](#) (page 44) list the signals and pin assignments.

The maximum current available from the 25 V supply for the external monitor is 4.0 A.

Figure 3-5 Apple display connector

Table 3-8 Digital signals on the Apple display connector

Pin	Signal name	Pin	Signal name
1	25 V Supply	16	TMDS Data1/3 Shield
2	25 V Supply	17	TMDS Data3–
3	LED	18	TMDS Data3+
4	TMDS Data0–	19	DDC CLock
5	TMDS Data0+	20	Clock Return
6	TMDS Data0/5 Shield	21	USB Data+
7	TMDS Data5–	22	USB Data–
8	TMDS Data5+	23	USB Return
9	DDC Data	24	TMDS Data2–
10	Vsync	25	TMDS Data2+
11	25 V Return	26	TMDS Data2/4 Shield
12	25 V Return	27	TMDS Data4–
13	Soft Power	28	TMDS Data4+
14	TMDS Data1–	29	Clock+
15	TMDS Data1+	30	Clock–

Table 3-9 Analog signals on the Apple display connector

Pin	Signal name
C1	Analog Blue Video
C2	Analog Green Video
C3	Analog Horizontal Sync
C4	Analog Red Video
C5	Analog RGB Return and DDC Return

The graphics data sent to the digital monitor use transition minimized differential signaling (TMDS). TMDS uses an encoding algorithm to convert bytes of graphics data into characters that are transition-minimized to reduce EMI with copper cables and DC-balanced for transmission over fiber optic cables. The TMDS algorithm also provides robust clock recovery for greater skew tolerance with longer cables or low-cost short cables. For additional information about TMDS, see the references shown in [“Digital Visual Interface”](#) (page 54).

DVI Connector

In addition to the ADC connector, both graphics cards also have a DVI connector. The DVI connector is a standard connector that carries only the digital video signals. [Figure 3-6](#) (page 45) shows the contact configuration; [Table 3-10](#) (page 45) lists the signals and pin assignments.

Figure 3-6 DVI connector

Table 3-10 Signals on the DVI connector

Pin	Signal name	Pin	Signal name
1	TMDS Data2–	13	TMDS Data3+
2	TMDS Data2+	14	+5V Power
3	TMDS Data2/4 Shield	15	Ground for +5V Power
4	TMDS Data4–	16	Hot Plug Detect
5	TMDS Data4+	17	TMDS Data0–
6	DDC Clock	18	TMDS Data0+
7	DDC Data	19	TMDS Data0/5 Shield
8	Analog vertical sync	20	TMDS Data5–
9	TMDS Data1–	21	TMDS Data5+
10	TMDS Data1+	22	TMDS Clock Shield
11	TMDS Data1/3 Shield	23	TMDS Clock+
12	TMDS Data3–	24	TMDS Clock–
C1	Analog red	C4	Analog horizontal sync
C2	Analog green	C5	Analog ground (analog R, G, B return)
C3	Analog blue		

The graphics data sent to the digital monitor use transition minimized differential signaling (TMDS). TMDS uses an encoding algorithm to convert bytes of graphics data into characters that are transition-minimized to reduce EMI with copper cables and DC balanced for transmission over fiber optic cables. The TMDS algorithm also provides robust clock recovery for greater skew tolerance with longer cables or low-cost short cables.

For information about TMDS, see the reference listed in [“Digital Visual Interface”](#) (page 54).

Note: The PowerMac G4 computer includes a DVI to VGA adapter.

Dual Display Extended and Mirror Modes

The PowerMac G4 is equipped with an ADC port for connecting an Apple display and a DVI port for a second digital display. Through these two ports, the PowerMac G4 supports dual displays in both extended desktop and video mirroring modes. Extended desktop mode lets users distribute work across two displays, increasing the amount of visible desktop space. Video mirroring mode displays the same information on both monitors, enabling the control of a presentation on one display, while allowing an audience to watch the presentation on a second display or projector. The PowerMac G4 can power two Apple Cinema HD Displays at a pixel resolution of 3800x1200.

To switch between extended desktop and video mirroring modes, open System Preferences, click Arrangement, and select or deselect the Mirror Displays option.

The scaling function is available when both monitors (main via ADC and second via DVI) are operating and the mirror mode is selected. However, the DVI monitor could have black borders during mirroring, depending on the supported timings between the two displays and on the monitor's selection algorithm. Both displays show full-sized images only when the display resolution for the second monitor is set to the first display's native resolution: 1920 by 1200. Both displays can operate with other resolution settings, but in mirror mode, one of them has a display that is smaller than the full screen and has a black border around it. With the resolution for the second monitor set to 640 by 480 or 800 by 600, the image on the first display is smaller than its screen. For resolution settings larger than 1280 by 854, the image on the second monitor is smaller than its screen.

Expansion

This chapter describes the expansion features of the PowerMac G4 computer: the DDR SDRAM expansion slots and the PCI expansion slots.

RAM Expansion

The main logic board has four DDR SDRAM expansion slots for dual in-line memory modules (DIMMs). Each DIMM can contain 256 and 512 MB (also is 128 MB- and 1GB-capable) of double data rate synchronous dynamic RAM (DDR SDRAM). At least one of the RAM expansion slots contains a factory installed DIMM.

The DIMMs can be installed one or more at a time. The system supports linear memory organization; no performance gains are seen when two DIMMs of the same size are installed. Any supported size DIMM can be installed in any DIMM slot, and the combined memory of all of the DIMMs installed is configured as a contiguous array of memory.

The memory slots will accept four 512-MB DIMMs (also is capable of 2-1 GB) for a maximum memory size of 2 GB.

For all microprocessor speeds and for both DDR226 and DDR333 SDRAM DIMMs, the PowerMac G4 supports CAS latencies of 2, 2.5, 3, 3.5, and 4.

DIMM Specifications

The RAM expansion slots accept 184-pin DDR SDRAM DIMMs that are 2.5 volt, unbuffered, 8-byte, nonparity, and DDR226-compliant (PC2100) or DDR333-compliant (PC2700).

Important: DDR200 (PC1600) or slower DIMMs do not work in the PowerMac G4 computer.

Important: DIMMs with any of the following features are not supported in the PowerMac G4 computer: registers or buffers, PLLs, ECC, parity, or EDO RAM.

Mechanical Specifications

The mechanical design of the DDR SDRAM DIMM is defined by the JEDEC specification JESD21-C, MODULES4_20_4, Release 11b. To find this specification on the World Wide Web, refer to [“RAM Expansion Modules”](#) (page 53).

The maximum height of DIMMs for use in the PowerMac G4 computer is 2 inches.

Electrical Specifications

The electrical design of the SDRAM DIMM is defined by the JEDEC specification JESD21-C, MODULES4_20_4, Release 11b. To find this specification on the World Wide Web, refer to [“RAM Expansion Modules”](#) (page 53).

The Serial Presence Detect (SPD) EEPROM specified in the JEDEC standard is required and must be set to properly define the DIMM configuration. The EEPROM is powered on 3.3 V. Details about the required values for each byte on the SPD EEPROM can be found on pages 68–70 of the JEDEC specification.

Important: For a DIMM to be recognized by the startup software, the SPD feature must be programmed properly to indicate the timing modes supported by the DIMM.

DIMM Configurations

The largest DIMM supported is a two-bank DIMM of 1 GB using 512 Mbit DDR SDRAM devices. The maximum number of devices per DIMM is 16.

Important: Power is delivered to the PowerMac G4 during sleep mode, so do not remove DIMMs while in sleep mode.

Table 4-1 shows information about the different sizes of DDR SDRAM devices used in the memory modules. The memory controller supports 64 Mbit, 128 Mbit, 256 Mbit, and 512 Mbit DDR SDRAM devices. The device configurations include three specifications: address range, word size, and number of banks. For example, a 1 M by 16 by 4 device addresses 1 M, stores 16 bits at a time, and has 4 banks.

The first column in [Table 4-1](#) (page 48) shows the memory size of the largest DIMM with that device size that the computer can accommodate. The third column specifies the number of devices needed to make up the 8-byte width of the data bus. The fourth column in the table shows the size of each bank of devices, which is based on the number of internal banks in each device and the number of devices per bank.

Table 4-1 Sizes of DDR SDRAM expansion DIMMS and devices

Size of DIMM	SDRAM device size	Device configuration	Devices per bank	Size of each bank
128 MB	128 Mbits	2 M x 16 x 4	4	64 MB
128 MB	64 Mbits	4 M x 8 x 2	8	64 MB
128 MB	64 Mbits	2 M x 8 x 4	8	64 MB
128 MB	256 Mbits	2 M x 32 x 4	2	64 MB
256 MB	128 Mbits	4 M x 8 x 4	8	128 MB
256 MB	256 Mbits	4 M x 16 x 4	4	128 MB
512 MB	256 Mbits	8 M x 8 x 4	8	256 MB
1 GB	512 Mbits	16 M x 8 x 4	8	512 MB

RAM Addressing

Signals A[0–12] on each SDRAM DIMM make up a 13-bit multiplexed address bus that can support several different sizes of SDRAM devices. [Table 4-2](#) (page 49) shows the address multiplexing modes used with the devices.

Table 4-2 Address multiplexing modes for SDRAM devices

Device size	Device configuration	Size of row address	Size of column address
128 Mbits	4 M x 8 x 4	12	10
128 Mbits	2 M x 16 x 4	12	9
128 Mbits	1 M x 32 x 4	12	8
256 Mbits	8 M x 8 x 4	13	10
256 Mbits	4 M x 16 x 4	13	9
256 Mbits	2 M x 32 x 4	13	8
512 Mbits	8 M x 8 x 4	14	10

PCI Expansion Slots

The PowerMac G4 computer has four expansion slots using the industry-standard peripheral component interconnect (PCI) bus.

The computer's case has five openings in the back for access to I/O connectors on cards in the four expansion slots and the AGP slot. The numbering on the casing is 1 through 5 and corresponds to the label on the PCB. Number one is the AGP slot and numbers two through five are PCI slots.

The expansion slots accept 33 MHz PCI cards with either 32-bit or 64-bit address and data buses. The PCI cards can use power at +5 V, +3.3 V, or both. The slots accept standard 6.88-inch and 12.283-inch PCI cards as defined by the PCI Local Bus Specification, Revision 2.1. The cards are required to use the standard ISA fence described in the specification.

The expansion slots support all the required PCI signals and certain optional PCI signals. The PCI slots support the optional 64-bit bus extension signals and cache support signals.

The PCI slots and the AGP-4x slot carry the 3.3 V_{AUX} power and PME signals to allow an expansion card to wake the computer from sleep mode.

The maximum total power available for all four PCI slots and the AGP-4x slot is 90 watts. The AGP-4x slot can account for up to 30 watts of that total, depending on which card is installed. FireWire ports can account for up to 15 watts.

To install or remove a PCI expansion card, the user first opens the door of the enclosure. Then the user removes the blank PCI fence for the appropriate slot, inserts the card in the slot, and screws the card's fence into place to secure the card. The user then closes the enclosure door and turns on the computer. In order to use the new PCI card, a driver must be installed. The driver installation procedure is documented by the manufacturer of the PCI card.

Important: Before removing or installing PCI expansion cards, shut down the computer and unplug the AC power cord. The PowerMac G4 computer does not support PCI hot-plugging functionality. When the computer is powered-on or asleep, the main logic board has a red LED to warn that power is present.

Supplemental Reference Documents

For more information about the technologies mentioned in this developer note, you may wish to consult some of the references listed in the following sections.

For information about older models of Macintosh computers, refer to the developer notes archive at:

<http://developer.apple.com/documentation/HardwareDrivers/index.html>

Apple Technical Notes

Apple Technical Notes answer many specific questions about the operation of Macintosh computers and the Mac OS. The notes are available on the Technical Note website at

<http://developer.apple.com/technotes/>

PowerPC G4 Microprocessor

Information about the PowerPC G4 microprocessor is available on the World Wide Web at

<http://www.freescale.com/webapp/sps/site/homepage.jsp?nodeId=0162468rH3bTdG>

Velocity Engine (AltiVec)

Velocity Engine is Apple's name for the AltiVec vector processor in the PowerPC G4 microprocessor. Apple provides support for developers who are starting to use the Velocity Engine in their applications. Documentation, development tools, and sample code are available on the Apple website, at

<http://developer.apple.com/hardware/drivers/ve/index.html>

AltiVec Technology Programming Environments Manual (AltiVec PEM) is a reference guide for programmers. It contains a description for each instruction and information to help in understanding how the instruction works. You can obtain a copy of the AltiVec PEM through the Freescale [AltiVec](#) documentation website.

3D Graphics

Developers of 3D graphics for games should know about OpenGL for Macintosh, a version of SGI's application programming interface (API) and software library for 3D graphics.

Information is available on the World Wide Web at

<http://www.apple.com/opengl>

Developer support and documentation is available at

<http://developer.apple.com/opengl/>

Mac OS X

Initially, the PowerMac G4 computer ships with Mac OS X 10.2.3 installed as the default operating system; later in the release, it will ship with Mac OS X 10.2.4. The classic environment can be used to run Mac OS 9 applications. For access to Apple's developer documentation for Mac OS X, see the Apple Developer Connection (ADC) website at

<http://developer.apple.com/documentation/index.html>

and

http://developer.apple.com/documentation/Carbon/Reference/Multiprocessing_Services/index.html

O'Reilly & Associates publishes a series of books about Mac OS X development. The books in this series have been technically reviewed by Apple engineers and are recommended by the Apple Developer Connection.

ROM-in-RAM Architecture

The system software in all current Macintosh computers uses a ROM-in-RAM approach, also called the NewWorld architecture. For more information refer to [ROM-in-RAM](#).

Open Firmware

The software architecture implemented on current Macintosh computers follows the standard defined by the Open Firmware IEEE 1274-1994 specification. Three Technotes provide an introduction to Open Firmware on the Macintosh platform. They are

TN 1061: *Open Firmware, Part I*, available on the Technote web site at

<http://developer.apple.com/technotes/tn/tn1061.html>

TN 1062: *Open Firmware, Part II*, at

<http://developer.apple.com/technotes/tn/tn1062.html>

TN 1044: *Open Firmware, Part III*, at

<http://developer.apple.com/technotes/tn/tn1044.html>

Other Technotes provide additional information about Open Firmware on the Macintosh.

TN 2000: *PCI Expansion ROMs and You*, at

<http://developer.apple.com/technotes/tn/tn2000.html>

TN 2001: *Running Files from a Hard Drive in Open Firmware*, at

<http://developer.apple.com/technotes/tn/tn2001.html>

TN 2004: *Debugging Open Firmware Using Telnet*, at

<http://developer.apple.com/technotes/tn/tn2004.html>

RAM Expansion Modules

The PowerMac G4 computer uses PC2100- or PC2700-compliant, 184-pin DDR SDRAM DIMMs.

The electrical and mechanical characteristics of the DIMM are given in JEDEC Standard 21-C. The specification can be found by using the search string JESD21-C on the Electronics Industry Association's website at

<http://www.jedec.org/DOWNLOAD/default.cfm>

ATA Devices

ATA (AT Attachment), also referred to as integrated drive electronics (IDE), is a standard interface used with storage devices such as hard disk drives. For more information on ATA, refer to the following Apple website at

<http://developer.apple.com/documentation/Hardware/DeviceManagers/ata/ata.html>

ATA Manager 4.0 supports driver software for internal IDE drives and includes DMA support. For the latest information about ATA Manager 4.0, see Technical Note #1098, *ATA Device Software Guide Additions and Corrections*, available on the World Wide Web at

<http://developer.apple.com/technotes/tn/tn1098.html>

The web page for Technical Note #1098 includes a link to a downloadable copy of *ATA Device Software Guide*.

Information about the ATA standards is available at the Technical Committee T13 AT Attachment website, at

<http://www.t13.org/>

USB Interface

For more information about USB on the Macintosh computer, refer to Apple Computer's *Mac OS USB DDK API Reference*. Information is also available on the World Wide Web, at

<http://developer.apple.com/documentation/Hardware/DeviceManagers/usb/usb.html>

USB game controllers are supported by the InputSprocket component of the Apple Games Sprockets software architecture. InputSprocket software and information about the InputSprocket APIs can be found at

<http://developer.apple.com/games/>

For full specifications of the Universal Serial Bus, you should refer to the USB Implementation Forum on the World Wide Web, at

<http://www.usb.org/developers/docs>

FireWire Interface

For additional information about the FireWire IEEE 1394a and 1394b interfaces and the Apple API for FireWire software, refer to the resources available on the Apple FireWire website at

<http://developer.apple.com/hardwaredrivers/firewire/>

The IEEE 1394a and 1394b standards are available from the IEEE; you can order these documents electronically from the IEEE Standards Department website at

<http://shop.ieee.org/store>

You may also find useful information at the 1394 trade association's website at

<http://www.1394ta.org/>

Digital Visual Interface

For information about transition minimized differential signaling (TMDS) used with digital video monitors, see the specification, Digital Visual Interface DVI Revision 1.0, available on the website of the Digital Display Working Group (DDWG) at

<http://www.ddwg.org/>

Wireless Networks

More information about Wi-Fi and wireless networks using the IEEE 802.11 standard is available on the [Wi-Fi Alliance Knowledge Center](#).

Bluetooth

For more information regarding Bluetooth technology, refer to the following locations on the World Wide Web.

Bluetooth specification:

<http://www.bluetooth.com/>

Bluetooth SIG:

<http://www.bluetooth.org/apps/content/>

Bluetooth developer tools on the Apple web site at:

<http://developer.apple.com/hardwaredrivers/bluetooth/>

Conventions and Abbreviations

This developer note uses the following typographical conventions and abbreviations.

Typographical Conventions

Note: A note like this contains information that is of interest but is not essential for an understanding of the text.

Important: A note like this contains important information that you should read before proceeding.

Warning: A note like this contains a warning about a situation that could cause a system crash or loss of data.

Abbreviations

When unusual abbreviations appear in this developer note, the corresponding terms are also spelled out. Standard units of measure and other widely used abbreviations are not spelled out.

Here are the standard units of measure used in developer notes:

A	amperes	mA	milliamperes
dB	decibels	A	microamperes
GB	gigabytes	MB	megabytes
Hz	hertz	MHz	megahertz
in.	inches	mm	millimeters
k	1000	ms	milliseconds
K	1024	s	microseconds
KB	kilobytes	ns	nanoseconds
kg	kilograms		ohms

A P P E N D I X B

Conventions and Abbreviations

kHz	kilohertz	sec.	seconds
k	kilohms	V	volts
lb.	pounds	W	watts

Other abbreviations used in developer notes include these:

ADC	Apple Display Connector
AGP	accelerated graphics port
ATA	advanced technology attachment
ATAPI	advanced technology attachment, packet interface
AV	audio visual
CAS	column address strobe
CAV	constant angular velocity
CD-ROM	compact disc read-only memory
CLV	constant linear velocity
DB-DMA	descriptor-based direct memory access
DDC	display data channel
DDR	double data rate, a type of SDRAM where data is clocked on rising and falling clock edges
DIMM	dual inline memory module
DIN	Deutsche Industrie Norm
DMA	direct memory access
DRAM	dynamic random-access memory
DVD	12 cm optical storage system with 4 GB capacity
DVD-ROM	DVD read-only memory
DVD-RAM	DVD that is both readable and writable
DVI	Digital Visual Interface
EDO	extended data out DRAM device type
EIDE	extended IDE
EMI	electromagnetic interference

G4	Generation 4, the fourth generation of PowerPC microprocessors, incorporating AltiVec technology
HID	human interface device, a class of USB devices
I2C	same as IIC
I2S	same as IIS
IC	integrated circuit
IDE	integrated device electronics
IEEE	Institute of Electrical and Electronics Engineers
IEEE 1275	the official specification for Open Firmware
IEEE 1394a	the official specification for FireWire 400 (400 Mbps)
IEEE 1394b	the official specification for FireWire 800 (800 Mbps)
IIC	inter-IC (an internal control bus)
IIS	inter-IC sound bus
I/O	input/output
ISO	International Organization for Standardization
JEDEC	Joint Electronics Devices Engineering Council
L2	level 2 (refers to level of cache)
L3	level 3 (refers to level of cache)
LAN	local area network
MAC	media access controller
Mac OS	Macintosh Operating System
OFDM	orthogonal frequency-division multiplexing
PCI	Peripheral Component Interconnect
PHY	physical layer
PIO	polled input/output
RADIUS	Remote Authentication Dial-In User Service
RAM	random-access memory
RAS	row address strobe
RBC	reduced block commands

RGB	a video signal format with separate red, green, and blue components
RISC	reduced instruction set computing
rms	root mean square
ROM	read-only memory
SBP	Serial Bus Protocol
SPD	Serial Presence Detect
SCSI	Small Computer System Interface
SCC	serial communications controller
SDR	single data rate
SDRAM	synchronous dynamic random access memory
SO-DIMM	small outline - dual inline memory module
SRAM	static random access memory
USB	Universal Serial Bus
TMDS	transition minimized differential signaling
VESA	Video Electronics Standards Association
VRAM	video RAM; used for display buffers
Wi-Fi	Used by the Wireless Ethernet Compatibility Alliance for certification of interoperability of 802.11 products

Index

A

abbreviations [57, 60](#)
accelerated graphics port bus, See AGP bus [20](#)
ADC [43](#)
AGP bus [18, 20](#)
AGP graphics card [24](#)
AirPort Extreme Admin Utility [37](#)
AirPort Extreme Application [37](#)
AirPort Extreme Base Station [36](#)
AirPort Extreme Card [21, 36, 37](#)
 hardware components [37](#)
 security features [36](#)
 software components [37](#)
AirPort Extreme Setup Assistant [37](#)
AltiVec [14](#)
Apple Speaker minijack [42](#)
ATA Device Software Guide [53](#)

B

block diagram [17](#)
block diagrams
 main logic board [17](#)
Bluetooth [54](#)
boot ROM [21](#)
booting from a FireWire device [31](#)
buses [17](#)
 AGP bus [18, 20](#)
 memory bus [18, 20](#)
 PCI bus [18](#)
 processor bus [18, 19](#)

C

clock speeds [18](#)
computer identification [14](#)
connectors

ADC [43](#)
Ethernet [32](#)
FireWire 400 [30](#)
FireWire 800 [29](#)
FireWire
 9-pin connector [29](#)
 headphone jack [41](#)
 USB [27](#)
connectors
 Apple Speaker minijack [42](#)
CPU power modes [14](#)
custom ICs
 KeyLargo I/O controller [22](#)
 PMU99 power controller [24](#)
 U2 bridge and memory controller [19](#)
 USB controllers [22](#)

D

DIMMs. See RAM DIMMs [47](#)
disk drives [33, 35](#)
displays
 mirror mode
 resolution settings [46](#)
DMA support [22](#)
dual display mode [46](#)

E

EIDE interface [23](#)
Ethernet controller [22](#)
Ethernet port [31](#)
expansion bus. See PCI expansion bus [49](#)
expansion slots [49](#)
external monitors
 dual display mode [46](#)
 mirror mode [46](#)

F

features summary [11](#)
FireWire 400 [30](#)
FireWire 800 [29](#)
FireWire connectors
 6-pin connector [30](#)
 9-pin connector [29](#)
FireWire controller [22](#)
FireWire device programming [28](#)
FireWire drivers [28](#)
FireWire ports [28, 31](#)
 booting from [31](#)
 Target Disk mode [31](#)
